<b>1</b>	<b>About</b>	<b>1</b>
<b>2</b>	<b>Usage</b>	<b>3</b>
2.1	How to Compile PEBL 2.0 . . . . .	3
2.1.1	Linux . . . . .	3
2.1.2	Microsoft Windows . . . . .	4
2.1.3	Mac OSX . . . . .	4
2.2	Installation . . . . .	4
2.2.1	Linux . . . . .	4
2.2.2	Microsoft Windows . . . . .	4
2.2.3	Macintosh OSX . . . . .	5
2.3	How to Run a PEBL Program . . . . .	5
2.3.1	Linux . . . . .	5
2.3.2	Microsoft Windows . . . . .	6
2.3.3	Macintosh OSX . . . . .	6
2.4	How to stop running a program . . . . .	6
2.5	Command-line arguments . . . . .	7
2.6	System Status Output . . . . .	9
<b>3</b>	<b>How to Write a PEBL Program</b>	<b>11</b>
3.1	Basic PEBL Scripts . . . . .	11
3.2	Case Sensitivity . . . . .	12
3.3	Syntax . . . . .	12
3.4	Expressions . . . . .	14
3.5	loop() syntax. . . . .	15
3.6	Variables . . . . .	16
3.6.1	Coercion/casting . . . . .	16
3.6.2	Variable Naming . . . . .	17
3.6.3	Variable Scope . . . . .	17
3.6.4	Copies and Assignment . . . . .	17
3.6.5	Passing by Reference and by Value . . . . .	18
3.7	Functions . . . . .	18
3.8	A Simple Program . . . . .	21

<b>4</b>	<b>Overview of Object Subsystems</b>	<b>23</b>
4.1	Lists . . . . .	23
4.1.1	Growing Lists . . . . .	24
4.1.2	Recursion on lists . . . . .	26
4.2	Fonts . . . . .	27
4.3	Colors . . . . .	29
4.4	Windows . . . . .	29
4.5	Graphical Widgets . . . . .	29
4.6	Images . . . . .	30
4.7	Canvases . . . . .	30
4.8	Shapes . . . . .	32
4.8.1	Circle . . . . .	32
4.8.2	Ellipse . . . . .	32
4.8.3	Square . . . . .	33
4.8.4	Rectangle . . . . .	33
4.8.5	Line . . . . .	33
4.8.6	Polygon . . . . .	34
4.8.7	Bezier . . . . .	34
4.9	Text Labels . . . . .	35
4.10	Text Boxes . . . . .	35
4.11	User-Editable Text Boxes . . . . .	35
4.12	Audio . . . . .	37
4.13	Movie Files . . . . .	37
4.14	Custom objects . . . . .	38
4.15	Keyboard Entry . . . . .	39
4.16	Joystick Input . . . . .	39
4.17	Files . . . . .	41
4.18	Network Connections . . . . .	43
4.18.1	TCP/IP Overview . . . . .	43
4.18.2	Addresses and Ports . . . . .	43
4.18.3	Sending and Receiving Data . . . . .	44
4.18.4	Closing networks . . . . .	44
4.19	Parallel Port . . . . .	44
4.20	Serial Port . . . . .	45
4.21	The Event Loop . . . . .	46
4.22	Parameter Setting . . . . .	46
4.23	Errors and Warnings . . . . .	47
4.24	Paths and Path Searching . . . . .	48
4.25	Controlling the Video settings . . . . .	48
4.25.1	Screen resolution . . . . .	49
4.25.2	Fullscreen mode . . . . .	49
4.25.3	Video drivers . . . . .	49
4.25.4	Synchronize to vertical refresh signal (vsync) . . . . .	49
4.25.5	Multiple windows . . . . .	50
4.26	StickyKeys . . . . .	51
4.27	Provided Media Files . . . . .	51

4.28	Special Variables . . . . .	53
<b>5</b>	<b>Function Quick Reference</b>	<b>55</b>
<b>6</b>	<b>The PEBL Layout &amp; Response System</b>	<b>73</b>
6.1	Overview . . . . .	73
6.2	Quick Start . . . . .	73
6.3	Layout Zones . . . . .	74
6.3.1	Zone Structure . . . . .	74
6.3.2	Accessing Zones . . . . .	75
6.3.3	Stimulus Region . . . . .	75
6.4	Response Modes . . . . .	75
6.4.1	Keyboard Modes . . . . .	75
6.4.2	Mouse Modes . . . . .	76
6.4.3	Platform-Aware Selection . . . . .	76
6.5	Parameter Integration . . . . .	76
6.5.1	Basic Usage . . . . .	76
6.5.2	Response Mode Parameter . . . . .	77
6.6	Translation Support . . . . .	77
6.6.1	Basic Usage . . . . .	77
6.6.2	Running in Different Languages . . . . .	78
6.7	Data Upload Integration . . . . .	78
6.7.1	Basic Usage . . . . .	78
6.8	Layout Customization . . . . .	79
6.8.1	Custom Layout Configuration . . . . .	79
6.8.2	Modifying Global Defaults . . . . .	80
6.9	Complete Example . . . . .	80
6.10	Best Practices . . . . .	83
6.10.1	Layout Usage . . . . .	83
6.10.2	Response Handling . . . . .	83
6.10.3	Parameters . . . . .	84
6.10.4	Translations . . . . .	84
6.11	Reference . . . . .	84
6.11.1	Core Functions . . . . .	84
6.11.2	Layout Properties . . . . .	85
6.11.3	Default Configuration . . . . .	85
<b>7</b>	<b>Structured Task Creation Architecture</b>	<b>87</b>
7.1	Overview . . . . .	87
7.2	Parameter Management System . . . . .	88
7.2.1	Basic Parameter Usage . . . . .	88
7.2.2	Parameter Files . . . . .	89
7.2.3	Parameter Schemas . . . . .	90
7.2.4	Parameter Presets . . . . .	91
7.2.5	Loading Parameters from URLs . . . . .	92
7.2.6	Best Practices . . . . .	92

7.3	Translation System . . . . .	93
7.3.1	Basic Translation Usage . . . . .	93
7.3.2	Translation File Structure . . . . .	94
7.3.3	Creating Translations . . . . .	95
7.3.4	Special Characters and Formatting . . . . .	95
7.3.5	Fallback Strategy . . . . .	96
7.3.6	Translation Best Practices . . . . .	98
7.4	Data Upload System . . . . .	99
7.4.1	Upload Configuration . . . . .	99
7.4.2	Using Upload in PEBL Scripts . . . . .	99
7.4.3	PEBL Simple Data Server . . . . .	101
7.4.4	PEBLHub Online . . . . .	104
7.4.5	Upload Best Practices . . . . .	105
7.5	Complete Example Task . . . . .	106
7.5.1	Directory Structure . . . . .	106
7.5.2	Parameter Schema . . . . .	106
7.5.3	Translation Files . . . . .	108
7.5.4	Main Script . . . . .	108
7.5.5	Running the Task . . . . .	113
7.6	Migration Checklist . . . . .	113
7.6.1	Parameters . . . . .	113
7.6.2	Translations . . . . .	113
7.6.3	Layout & Response System . . . . .	114
7.6.4	Data Upload . . . . .	114
7.7	Summary . . . . .	114
<b>8</b>	<b>The PEBL Launcher</b>	<b>117</b>
8.1	History of the Launcher . . . . .	118
8.2	How it works . . . . .	118
8.3	Features . . . . .	119
8.3.1	File browser . . . . .	119
8.3.2	Participant code . . . . .	119
8.3.3	Experimenter code . . . . .	120
8.3.4	Language . . . . .	120
8.3.5	Command Line Options . . . . .	121
8.3.6	Edit and Parameters . . . . .	121
8.3.7	Fullscreen Mode . . . . .	121
8.3.8	Demographics Collection . . . . .	122
8.3.9	Experiment Chains . . . . .	122
8.3.10	Saving Experiment Chains . . . . .	122
8.3.11	Editing Experiment chains . . . . .	123
8.3.12	Loading Experiment Chains . . . . .	123
8.3.13	Description and Screenshot . . . . .	123
8.3.14	Message feedback windows . . . . .	124
8.3.15	Other buttons . . . . .	124
8.3.16	Menu . . . . .	125

8.4	Launching an experiment . . . . .	126
8.5	Launching an experiment chain . . . . .	126
8.6	Translating the Launcher . . . . .	127
8.7	Utility:Parameter setting . . . . .	127
8.8	Utility: Combining data files . . . . .	128
<b>9</b>	<b>PEBL User Interface Functions</b>	<b>131</b>
9.1	Overview . . . . .	131
9.2	TextEntry . . . . .	132
9.2.1	Usage . . . . .	132
9.2.2	Methods and related functions . . . . .	133
9.3	Menu . . . . .	133
9.3.1	Usage . . . . .	133
9.3.2	Methods and related functions . . . . .	134
9.4	PullDown . . . . .	134
9.4.1	Usage . . . . .	135
9.4.2	Methods and related functions . . . . .	136
9.5	Button . . . . .	136
9.5.1	Methods . . . . .	136
9.5.2	Usage . . . . .	137
9.6	Checkbox . . . . .	137
9.6.1	Usage . . . . .	137
9.6.2	Methods and associated functions . . . . .	138
9.7	Scrollbox . . . . .	138
9.7.1	Usage . . . . .	138
9.7.2	Methods and related functions . . . . .	139
9.8	ScrollingTextBox . . . . .	139
9.8.1	Usage . . . . .	140
9.8.2	Methods and related functions . . . . .	140
9.9	PopupMessageBox . . . . .	140
9.9.1	Usage . . . . .	141
9.10	PopUpEntryBox . . . . .	141
9.10.1	Usage . . . . .	141
<b>10</b>	<b>The PEBL Psychological Test Battery</b>	<b>143</b>
10.1	About the PEBL Test Battery . . . . .	143
10.2	Setting Parameters of Battery Tests . . . . .	143
10.3	Translating or changing test instructions . . . . .	144
10.4	The Tests . . . . .	146
<b>11</b>	<b>Detailed Function and Keyword Reference</b>	<b>167</b>
11.1	PEBLEnvironment - System and Environment . . . . .	168
11.1.1	ClearEventLoop() . . . . .	171
11.1.2	CopyFromClipboard() . . . . .	171
11.1.3	CallFunction() . . . . .	171
11.1.4	CheckProcessStatus() . . . . .	172

11.1.5 DeleteFile()	173
11.1.6 ExitQuietly()	173
11.1.7 FileExists()	174
11.1.8 GetCurrentScreenResolution()	174
11.1.9 GetDirectoryListing()	175
11.1.10 GetDrivers()	176
11.1.11 GetExecutableName()	176
11.1.12 GetHomeDirectory()	176
11.1.13 GetJoystickAxisState()	177
11.1.14 GetJoystickBallState()	177
11.1.15 GetJoystickButtonState()	178
11.1.16 GetJoystickHatState()	178
11.1.17 GetMouseCursorPosition()	178
11.1.18 GetMouseState()	179
11.1.19 GetNumJoystickAxes()	180
11.1.20 GetNumJoystickBalls()	180
11.1.21 GetNumJoystickButtons()	180
11.1.22 GetNumJoystickHats()	181
11.1.23 GetNumJoysticks()	181
11.1.24 GetPEBLVersion()	181
11.1.25 GetSystemType()	182
11.1.26 GetTextBoxCursorFromClick()	182
11.1.27 GetTime()	183

# Chapter 1

## About

PEBL (Psychology Experiment Building Language) is a cross-platform, open-source programming language and execution environment for constructing programs to conduct a wide range of archetypal psychology experiments. It is entirely free of charge, and may be modified to suit your needs as long as you follow the terms of the GPL, under which the source code is licensed. PEBL is written primarily in C++, but requires a few other tools (`flex`, `yacc`) and the 2.0 branch of the SDL libraries (`SDL`, `SDL_image`, `SDL_gfx`, and `SDL_ttf`) to use. In addition, a set of audio recording functions are available using the (now old and basically unmaintained) `sdl_audioin` library. Finally, the `waave` library optionally supports movie playback on linux and windows.

It currently compiles and runs on Linux (using `g++`), Mac OSX (using `xcode`), and Microsoft Windows (using `code:blocks` and `mingw`) platforms using free tools. It has been developed primarily by Shane T. Mueller, Ph.D. ([smueller@obereed.net](mailto:smueller@obereed.net)). This document was prepared with editorial and formatting help from Gulab Parab and Samuele Carcagno. In addition, much of the material in the chapter on the PEBL Test battery was contributed by Bryan Rowley. Contributions are welcome and encouraged.

# Chapter 2

## Usage

Most users will be able to download a precompiled version of PEBL and run experiments directly. Some advanced users may wish to compile their own version, however. The next section describes how to do this.

### 2.1 How to Compile PEBL 2.0

Currently, there is no automated compile procedure. PEBL requires the `SDL2`, `SDL2_image`, `SDL2_gfx`, `SDL2_net`, `SDL2_audio` and `SDL2_ttf` libraries and development headers. It also uses `flex` and `bison`, but you can compile without these tools. PEBL compiles on both Linux and Windows using the free `gcc` compiler; on windows this is most easily supported through the code:blocks IDE. Note that `SDL-image` may require `jpeg`, `png`, and a `zlib` compression library, while `SDL-ttf` uses `truetype` 2.0.

#### 2.1.1 Linux

PEBL should compile by typing ‘`make`’ in its base directory once all requisite tools are installed and the source distribution is uncompressed. Currently, PEBL does not use autotools, so its make system is rather brittle. Assistance is welcome.

On Linux, compiling will fail if you don’t have an `/obj` directory and all the appropriate subdirectories (that mirror the main tree.) These will not exist if you check out from CVS.

### 2.1.2 Microsoft Windows

On Microsoft Windows, PEBL is designed to be compiled using the Free IDE `code:blocks`. A `code:blocks` project file is included in the source code directory. Email the PEBL list for more details.

### 2.1.3 Mac OSX

Originally, PEBL compiled to a command-line function. Since 0.12, PEBL will compile to a `.app` package using `xcode`. An `xcode` package is available in the source archive.

## 2.2 Installation

### 2.2.1 Linux

On Linux, there are `.deb` packages available for `debian`. However, it is fairly easy to compile and install from source. To begin, be sure that all the `sdl` packages are installed. Then, go to the main `pebl` directory and type:

```
>make
>sudo make install
```

Once installed, you can install the test battery into `Documents/pebl-exp.X` using the command `pebl -install`.

### 2.2.2 Microsoft Windows

In Microsoft Windows, we provide an installer package that contains all necessary executable binary files and `.dlls`. This installer places PEBL in `c:\Program Files\PEBL`, and creates a directory `pebl-exp.X` in `My Documents` with a shortcut that allows PEBL to be launched and programs that reside there to be run.

### 2.2.3 Macintosh OSX

For OSX, we provide a `.app` package that can be dragged into your Applications folder. The first time any user runs `pebl`, it gives the option to install the battery and other files into Documents  
`pebl-exp.X`. Afterward, it will run the launcher from that directory.

## 2.3 How to Run a PEBL Program

The simplest way to run any PEBL script is via the launcher, which is available on all platforms. The launcher is covered in detail in Chapter 6. But, you can also launch experiments individually on each platform.

### 2.3.1 Linux

If you have installed PEBL into `/usr/local/bin`, you will be able to invoke PEBL by typing `'pebl2'` at a command line. PEBL requires you to specify one or more source files that it will compile and run, e.g., the command:

```
> pebl2 stroop.pbl library.pbl
```

will load the experiment described in `stroop.pbl`, and will load the supplementary library functions in `library.pbl`.

Additionally, PEBL can take the `-v` or `-V` command-line parameter, which allows you to pass values into the script. This is useful for entering subject numbers and condition types using an outside program like a bash script (possibly one that invokes `dialog` or `zenity`). A sample `zenity` script that asks for subject number and then runs a sample experiment which uses that input resides in the `bin` directory. The script can be edited to use fullscreen mode or change the display dimensions, for example. See Section 2.3.3: Command-Line Arguments.

You can also specify directories without a filename on the command-line (as long as they end with `'/'`). Doing so will add that directory to the search path when files are opened.

### 2.3.2 Microsoft Windows

PEBL can be launched from the command line in Windows by going to the `pebl\bin` directory and typing `'pebl.exe'`. PEBL requires you to specify one or more source files that it will compile and run. For example, the command

```
> pebl2.exe stroop.pbl library.pbl
```

loads the experiment described in `stroop.pbl`, and loads supplementary library functions in `library.pbl`.

Additionally, PEBL can take the `-v` or `-V` command-line parameter, which allows you to pass values in to the script. This is useful for entering condition types using an outside program like a batch file. the `-s` and `-S` allow one to specify a subject code, which gets bound to the `gSubNum` variable. If no value is specified, `gSubNum` is initialized to 0. You can also specify directories without a file (as long as they end with `'\'`). Doing so will add that directory to the search path when files are opened. See Section 2.3.3: Command-Line Arguments.

Launching programs from the command-line on Windows is cumbersome. One easy way to launch PEBL on Windows is to create a shortcut to the executable file and then edit the properties so that the shortcut launches PEBL with the proper script and command-line parameters. Another way is to write and launch a batch file, which is especially useful if you wish to enter configuration data before loading the script.

### 2.3.3 Macintosh OSX

The latest version of PEBL packaged for OSX is 0.12. It is compiled as an application bundle with both 32-bit and 64-bit architectures available. We do not support PPC architecture.

The simplest way to run PEBL is through the launcher, but you can also use Applescript to create your own sequences of experiments.

On OSX, PEBL can be run as a command-line tool, just as in linux. Once installed, the application is located at `/Applications/pebl.app/Contents/MacOS/pebl2`.

## 2.4 How to stop running a program

In order to improve performance, PEBL runs at the highest priority possible on your computer. This means that if it gets stuck somewhere, you may have difficulty terminating the process. We have added an 'abort program' shortcut key combination that will immediately terminate the program and report the

location at which it became stuck in your code:  
press <CTRL><SHIFT><ALT><\> simultaneously.

## 2.5 Command-line arguments

Some aspects of PEBL's display can be controlled via command-line arguments. Some of these are platform specific, or their use depends on your exact hardware and software. The following guide to command-line arguments is adapted from the output produced by invoking PEBL with no arguments:

Usage: Invoke PEBL with the experiment script files (.pbl) and command-line arguments.

Examples:

```
pebl2 experiment.pbl -s sub1 --fullscreen --display 800x600
      --driver dga
pebl2 experiment.pbl --driver xf86 --language es
pebl2 experiment.pbl -v 33 -v 2 --fullscreen --display 640x480
```

### Command-Line Options

**-v VALUE1 -v VALUE2**

Invokes script and passes VALUE1 and VALUE2 (or any text immediately following a -v) to a list in the argument of the **Start()** function.

This is useful for passing in conditions, subject numbers, randomization cues, and other entities that are easier to control from outside the script. Variables appear as strings, so numeric values need to be converted to be used as numbers.

**-s VALUE**  
**-S VALUE**

Binds VALUE to the global variable gSubNum, which is set by default to 0.

**--driver <drivername>**

Sets the video driver, when there is more than one. On all platforms, opengl and software should be available. In Linux, opengles is also available, and on windows, direct3d.

**--display <widthxheight>**

Controls the screen width and height (in pixels). Defaults to the current resolution of the screen. Unlike older versions of PEBL, after 0.12 any legal combination of width and height should work.

The screensize a PEBL script runs at depends on a number of things. If no `--display size` is given (e.g., when 'default' is chosen in the launcher), PEBL will try to determine the current screen size and use that, for both fullscreen and windowed mode. Otherwise, it will try to use the specified value.

However, these values are only a request. When the script starts, it sets the values of the global variables `gVideoWidth` and `gVideoHeight` based on either the specified values or the current screen size. These values can be changed in the script before the `MakeWindow` function is called, so that a script can require a particular screen size. Then, the window will be created with those dimensions, overriding any command-line parameters. For greatest flexibility, it is recommended that you do not hard-code screen size but rather make your test adapt to a large number of screen sizes.

Finally, if a screen size is selected that the video card cannot support (i.e., in fullscreen mode), `gVideoWidth` and `gVideoHeight` will be set to the legal screen size closest to the one you requested. PEBL should never crash because you have specified the wrong screen size, but it should rather use one it can support. The values of `gVideoWidth` and `gVideoHeight` will be changed by `MakeWindow` to whatever screen size it actually uses.

**--depth**

Controls the pixel depth, which also depends on your video card. Currently, depths of 2,8,15,16,24, and 32 are allowed on the command-line. There is no guarantee that you will get the specified bit depth, and bit depths such as 2 and 8 are likely never useful. Changing depths can, for some drivers and video cards, enable better performance or possibly better video synchrony. Defaults to 32.

**--language <code>**

Specifies the language for translations. Sets the global variable `gLanguage`. Can be a two-letter ISO 639-1 code (e.g., "en", "es", "fr") or any custom identifier. The translation system uses a three-tier fallback: (1) try the specified language, (2) try the system locale if no language was specified, (3) fall back to English. If not set, defaults to empty string, triggering system locale detection.

**--windowed** or **--fullscreen** Controls whether the script will run in a window or fullscreen. The screen resolution a PEBL script runs at depends on a number of things. See the **--display** option above for more details.

**--resizeable**

**--resizable**

Controls whether the window will be resizeable. Only works in windowed mode. Either spelling is accepted.

**--unicode**

Turns on Unicode text handling, with slight performance overhead. Enabled by default. Required for displaying non-ASCII characters in multiple languages.

**--pfile <filename>**

Specifies which parameter file to use. The filename is bound to the global variable `gParamFile`. Can be a local filename (prepended with “`params/`”) or a full URL (`http://` or `https://`) for remote parameter loading.

**--upload <filename>**

Specifies an `upload.json` configuration file to use for syncing data with a remote data server (PEBL Simple Data Server or PEBLHub). Sets `gUpload` to true and `gUploadFile` to the specified filename.

**--vsyncon**

**--vsyncoff**

Controls vertical synchronization (vsync). `--vsyncon` enables vsync for tasks requiring precise control of video refresh timing, but may be finicky on some hardware. `--vsyncoff` disables vsync (the default). The `gVSync` global variable is set accordingly and can be tested within scripts.

**--softrender**

Forces use of software renderer instead of hardware-accelerated rendering. Automatically disables vsync. Sets the `gSoftRender` global variable to true. Useful for debugging graphics issues or running on systems without proper GPU drivers.

**--help**

Displays the command-line help screen with all available options.

**--showtestresults**

Sets the global variable `gShowTestResults` to 1 (instead of 0). Allows a test to automatically show a screen with results at the end, useful for self-paced experiments or demonstrations.

## 2.6 System Status Output

To help you debug what is happening and determine the system settings, information about PEBL system settings are printed out to `stderr.txt`. When a window is created, the following information will be printed out.

### Driver information

First, the available drivers will be described. All platforms should have `opengl` and `software`, along with additional platform-specific drivers.

```
=====
Available drivers
=====
Render driver count: 3
Driver name (0): opengl
the renderer uses hardware acceleration
present is synchronized with the refresh rate
the renderer supports rendering to texture
Driver name (1): opengles2
the renderer uses hardware acceleration
present is synchronized with the refresh rate
the renderer supports rendering to texture
Driver name (2): software
the renderer is a software fallback
the renderer supports rendering to texture
=====
```

Next, specific information about the video display and system will be printed.

```
-----

```

## Chapter 3

# How to Write a PEBL Program

### 3.1 Basic PEBL Scripts

PEBL has a fairly straightforward and forgiving syntax, and implements most of its interesting functionality in a large object system and function library of over 125 functions. The library includes many functions specific to creating and presenting stimuli and collecting responses. Efforts, however successful, have been made to enable timing accuracy at a millisecond-scale, and to make machine limitations easy to deal with.

Each PEBL program is stored in a text file. Currently, no special authoring environment is available. A program consists of one or more functions, and *must* have a function called `Start()`. Functions are defined with the following syntax:

```
define <function_name>(parameters)
{
    statement 1
    statement 2
    ....
    return value3
}
```

The parameter list and the return value are optional. For the `Start(par){}` function, `par` is normally bound to 0. However, if PEBL is invoked with `-v` command-line parameters, each value that follows a `-v` is added to a list contained in `'par'`, which can then be accessed within the program:

```
define Start(par)
{
    Print(First(par))
}
```

A simple PEBL program that actually runs follows:

```
define Start(par)
{
    Print("Hello")
}
```

`Print()` is a standard library function. If you run PEBL from a command-line, the text inside the `Print` function will be sent to the console. On Windows, it will appear in the file `'stdout.txt'` in the PEBL directory. Although other functions do not need a parameter argument, the `Start()` function does (case values are passed in from the command-line).

A number of sample PEBL programs can be found in the `/demo` subdirectory.

## 3.2 Case Sensitivity

PEBL uses case to specify an item's token type. This serves as an extra contextual cue to the programmer, so that the program reads more easily and communicates more clearly.

Function names must start with an uppercase letter, but are otherwise case-insensitive. Thus, if you name a function `"DoTrial"`, you can call it later as `"DOTRIAL"` or `"Dottrial"` or even `"DotRail"`. We recommend consistency, as it helps manage larger programs more easily.

Unlike function names, variable names must start with a lowercase letter; if this letter is a 'g', the variable is global. This enforces a consistent and readable style. After the first character, variable names are caseinsensitive. Thus, the variable `'mytrial'` is the same as `'myTrial'`.

Currently, syntax keywords (like `loop`, `if`, `define`, etc.) must be lowercase, for technical reasons. We hope to eliminate this limitation in the future.

## 3.3 Syntax

PEBL has a simple and forgiving syntax, reminiscent of `S+` (or `R`) and `c`. However, differences do exist.

**Table 1:** PEBL Symbols and Keywords

Symbol/Keyword	Usage
+	Adds two expressions together
-	Subtracts one expression from another
/	Divides one expression by another
*	Multiplies two expressions together
^	Raises one expression to the power of another
;	Finishes a statement, or starts a new statement on the same line (is not needed at end of line)
.	The property accessor. Allows properties to be accessed by name
:	Used to specify a default value in a function definition, and to access global function definitions
<-	The assignment operator
( )	Groups mathematical operations
{ }	Groups a series of statements
[ ]	Creates a list
#	Comment—ignore everything on the line that follows
<	Less than
>	Greater than
<=	Less than or equal to
>=	Greater than or equal to
==	Equal to
<> != ~=	Not equal to
and	Logical and
break	Breaks out of a loop prematurely
not	Logical not
or	Logical or
while	Traditional while loop
loop	Loops over elements in a list
if	Simple conditional test
if...else	Complex conditional test
if...elseif...else	Extended conditional chain
define	Defines a function
return	Allows a function to return a value

Table 1 shows a number of keywords and symbols used in PEBL. These need not appear in lowercase in your program.

Note that the '=' symbol does not exist in PEBL. Unlike other languages, PEBL does not use it as an assignment operator. Instead, it uses '<-'. Because it is confusing for users to keep track of the various uses of the = and == symbols, we've eliminated the '=' symbol entirely. Programmers familiar with `c` will notice a resemblance between PEBL and `c`. Unlike `c`, in PEBL a semicolon is not necessary to finish a statement. A carriage return indicates a statement is complete, if the current line forms a complete expression. You may terminate every command with a ';' if you choose, but it may slow down parsing and execution.

Another difference between `c` and PEBL is that in PEBL, {} brackets are not optional: they are required to define code blocks, such as those found in `if` and `while` statements and loops.

## 3.4 Expressions

An expression is a set of operations that produces a result. In PEBL, every function is an expression, as is any single number. Expressions include:

```
3 + 32
(324 / 324) - Log(32)
not lVariable
Print(32323)
"String " + 33
nsuho #this is legal if nsuho has been defined already.
```

Notice that "String " 33+ is a legal expresison. It will produce another string: "String 33".

These are not expressions:

```
NSUHO          #Not an expression
( 33 + 33      #Not an expression
444 / 3342 +   #Not an expression
```

NSUHO is not a variable because it starts with a capital letter. The other lines are incomplete expressions. If the PEBL parser comes to the end of a line with an incomplete expression, it will automatically go to the next line:

```
Print("hello " +
      " world."
)
```

This can result in bugs that are hard to diagnose:

```
a <- 33 + 323 +  
Print(1331)
```

sets `a` to the string "3561331".

But if a carriage return occurs at a point where the line does make a valid expression, it will treat that line as a complete statement:

```
a <- 33 + 323  
* 34245
```

sets `a` equal to 356, but creates a syntax error on the next line.

Any expression can be used as the argument of a function, but a function may not successfully operate when given bogus arguments.

If a string is defined across line breaks, the string definition will contain a linebreak character, which will get printed in output text files and textboxes.

```
text <- "this is a line  
and so is this"
```

If you desire a long body of text without linebreaks, you must define it piecemeal:

```
text <- "This is a line " +  
        "There is no line break before this line."
```

### 3.5 loop() syntax.

The main way of iterating in PEBL is via the loop syntax. Some examples include:

```
loop(i, [1,2,3])  
{  
  Print(i)  
}  
  
loop(i, ["a","b","c"])  
{  
  Print(i)  
}  
  
loop(i,10)  
{  
  Print(i)  
}
```

The loop function will execute the code in the brackets multiple times; once for each element of the list specified as the second argument. On each iteration, the variable named in the first argument will be bound to a different value. As of

2.0, the if the second argument is an integer, loop will automatically create a list and iterate over the values 1...N up to the specified number. So, the following two are identical:

```
loop(i, Sequence(1,1000,1))
{
  Print(i)
}
```

```
loop(i, 1000)
{
  Print(i)
}
```

In the future, the second version may be altered to be faster or use less memory.

## 3.6 Variables

PEBL can store the results of expressions in named variables. Unlike many programming languages, PEBL only has one type of variable: a “Variant”. This variable type can hold strings, integers, floating-point numbers, lists, graphical objects, and everything else PEBL uses to create an experiment. Unlike other languages, a variable need not be declared before it can be used. If you try to access a variable that has not yet been declared, PEBL will return a fatal error that stipulates as such.

### 3.6.1 Coercion/casting

Variants just hide the representational structure from the user. An actual string resides within the variant that holds a string. A long integer resides within the variant that holds an integer.

PEBL Variants are automatically coerced or cast to the most appropriate inner format. For example, `3232.2 + 33` starts out as a floating point and an integer. The sum is cast to a floating point number. Similarly, `"banana" + 33` starts as a string and an integer, but the combination is a string.

### 3.6.2 Variable Naming

All variables must begin with a lowercase letter. Any sequence of numbers or letters may follow that letter. If the variable begins with a lowercase ‘g’, it has global scope; otherwise it has local scope.

### 3.6.3 Variable Scope

As described above, variables can have either local or global scope. Any variable with global scope is accessible from within any function in your program. A variable with local scope is accessible only from within its own function. Different functions can have local variables with the same name. Generally, it is a good idea to use local variables whenever possible, but using global variables for graphical objects and other complex data types can be intuitive.

### 3.6.4 Copies and Assignment

Variables may contain various types of data, such as simple types like integers, floating-point ratio numbers, strings; and complex types like lists, windows, sounds, fonts, etc. A variable can be set to a new value, but by design, there are very few ways in which a complex object can be changed once it has been set. For example:

```
woof    <- LoadSound("dog.wav")
meow    <- LoadSound("cat.wav")
dog     <- woof
```

Notice that `woof` and `dog` refer to the same sound object. Now you may:

```
PlayBackground(woof)
Wait(50)
Stop(dog)
```

which will stop the sound from playing. If instead you:

```
PlayBackground(woof)
Wait(50)
Stop(meow)
```

`woof` will play until it is complete or the program ends.

Images provide another example. Suppose you create and add an image to a window:

```
mWindow <- MakeWindow()
mImage  <- MakeImage("test.bmp")
AddObject(mImage, mWindow)
Draw()
```

Now, suppose you create another variable and assign its value to `mImage`:

```
mImage2 <- mImage
Move(mImage2, 200, 300)
Draw()
```

Even though `mImage2` was never added to `mWindow`, `mImage` has moved: different variables now point to the same object. Note that this does not happen for simple (non-object) data types:

```
a <- 33
b <- a
a <- 55
Print(a + " " + b)
```

This produces the output:

```
55 33
```

This may seem confusing at first, but the consistency pays off in time. The '`<-`' assignment operator never changes the value of the data attached to a variable, it just changes what the variable points to. PEBL is functional in its handling of simple data types, so you can't, for example, directly modify the contents of a string.

```
a <- "my string"    #assigns a string literal to a
b <- a              #makes b refer to a's string literal
a <- "your string"  #re-assigns a to a new string literal
b <- a              #makes b refer to a's new string literal
```

### 3.6.5 Passing by Reference and by Value

The discussion in 3.6.4 on copying has implications for passing variables into functions. When a variable is passed into a function, PEBL makes a copy of that variable on which to operate. But, as discussed in 3.6.4, if the variable holds a complex data type (object or a list), the primary data structure allows for direct modification. This is practical: if you pass a window into a function, you do not want to make a copy of that window on which to operate. If the value is a string or a number, a copy of that value is made and passed into the function.

## 3.7 Functions

The true power of PEBL lies in its extensive library of functions that allow specific experiment-related tasks to be accomplished easily. For the sake of convenience, the library is divided into a number of subordinate libraries. This

### **Chapter 3.** How to Write a PEBL Program

---

library structure is transparent to the user, who does not need to know where a function resides in order to use it. Chapter 5 includes a quick reference to functions; Chapter 12 includes a complete alphabetical reference.

To create your own function, you use the `define` keyword, followed by the (Uppercase) function name, the arguments, and the code delineated by brackets. Within a function, the passed-in arguments and any new parameters will have a scope local to that function. Any variables starting with a 'g' value will have global scope, and be available outside the function.

Version 2.0 introduces two important new features to functions: optional/default arguments and global-namespace functions.

#### **Optional/Default arguments**

When you define a function, you can specify a default value by following the variable name with a colon and the default value.

```
define FunctionName(arg1, arg2:0, arg3:10)
{
    Print(arg1+arg2+arg3)
}
```

When calling a function, it must be called with all its non-optional arguments, but if an optional argument is not given, it will take on the default value. Currently, if you cannot specify non-default values for arguments that occur after the first default value you use, so in the above situation, you can call `FunctionName(1)`, `Function(1,1,1)`, or `FunctionName(1,1,1)`, but you can't skip the second argument.

#### **Calling functions in the global namespace**

PEBL has two types of functions: built-in functions written in C++, and a library of functions written in PEBL (located in the `pebl-lib` directory of the PEBL directory). For all functions, if you define a function with a name identical to an already-defined function, it will use your newly-defined function instead of the original. However, if the original was a compiled function, you can still access that function by pre-pending the name with a colon.

This is useful if you want to rename a function for debugging or other purposes, but still want to access the original. For example, supposed I wanted to log the time of each `Draw()` function, I could redefine `Draw`:

```
define Draw(x)
{
    Print("Draw command issued:" + GetTime())
    :Draw(x)
}
```

}

We use this in the Debug.pbl directory, which opens up a debugging window and prints to the window.

## 3.8 A Simple Program

The previous sections provide everything you need to know to write a simple program. Here is an annotated program:

```
# Any line starting with a # is a comment.  It gets ignored.

#Every program needs to define a function called Start()
#Start always needs a parameter
define Start(par)
{

    number <- 10    ##Assign a number to a variable

    hello <- "Hello World" ##Assign a string to a variable
    ##Create a global variable (starts with little g)
    gGlobalText <- "Global Text"

    ##Call a user-defined function (defined below).
    value <- PrintIt(hello, number)
    ##It returned a value
    #Call a built-in function
    Print("Goodbye. " + value)
}

##Define a function with two variables.
define PrintIt(text, number)
{
    #Seed RNG with the current time.
    RandomizeTimer()
    #Generate a random number between 1 and number
    i <- RandomDiscrete(number) #this is a built-in function
    ##Create a counter variable
    j <- 0
    ##Keep sampling until we get the number we chose.
    while(i != number)
    {
        Print(text + " " + i + gGlobalText)
        i <- RandomDiscrete(number)
        j <- j + 1
    }

    return(j) #return the counter variable.
}
```

### ***Chapter 3.*** How to Write a PEBL Program

---

More sample programs can be found in the `demo/` and `experiments/` directories of the PEBL source tree.

## Chapter 4

# Overview of Object Subsystems

In PEBL, complex objects are stored and automatically self-managed. These objects include lists, graphical display widgets like images and text displays, fonts, colors, audio files, and input or output files. Objects are created and modified with special functions, but many of their properties available directly for access and modification with a `variable.property` syntax. For example, the position of a textbox is controlled by `.X` and `.Y` properties, and can also be changed with the `Move()` function. To move the label `lab`, which is located at 100,100, to 150,100, you can either do `Move(lab,150,100)` or `lab.X <- 150`. The available properties and accessor function are listed in the descriptions of their relevant objects below.

### 4.1 Lists

Lists are incredibly useful and flexible storage structures that play an important role in PEBL. A list is simply a series of variables. It is the equivalent to a vector, array, or other similar data structure in many other programming languages.

Creating and accessing elements of lists can be accomplished in a number of ways. If you have a set of values you want to create a list from, you simply need to put them inside square brackets, separated by commas:

```
mylist <- [1,2,3,4,5,6,7,8,9]
```

Many functions related to experimental design return lists already created. Two simple functions are `Repeat` and `Sequence`:

```
list1 <- Repeat(0,10)      ##ten zeroes
```

```
list2 <- Sequence(0,20,2) ##numbers 0 to 20 step 2
```

Accessing list items can be done in a number of ways. The simplest is using the `Nth()` function. For a slightly more complex example, suppose you want to print out every item in a list. Looping through, accessing, and printing all the items of a list using this approach:

```
list <- Sequence(1,9,1)
len <- Length(list)
i <- 1
while (i <= len)
{
  item <- Nth(list,i)
  Print(item)
  i <- i + 1
}
```

Note that prior to PEBL 0.12, using `Nth` to access list items was inefficient. Since PEBL 0.13, you can use `Nth` to access list items in amortized constant time! But nevertheless, the above method of looping is verbose and error-prone. There is an alternative. Items from lists can be iterated over using the ‘`loop`’ command:

```
list <- Sequence(1,9,1)
loop(item, list)
{
  Print(item)
}
```

These two code blocks produce identical output, but in the former block, each item of the list must be found on each iteration, but in the latter block, a list item is bound directly to ‘`item`’ on each iteration. There is no appreciable difference in the efficiency of these two methods, but the second is simpler and in many cases easier to use, and avoids some errors (like forgetting to increment `i`).

### 4.1.1 Growing Lists

Oftentimes, you want to create a list one element at a time. For example, you may have a sampling scheme for stimuli and need to pick each consecutive randomly, or you want to record response times or accuracies one trial at a time. There are two ways you can do this. If you know how long your list will be, you can create a list with as many elements as you need, and then alter each element one at a time.

```
##I need ten items
```

```
items <- Repeat(0,10)
i <- 1
while(i <= Length(items))
{
  SetElement(items,i,Random())
}
```

Oftentimes, however, this is difficult because you do not know how long the list should be at the beginning. The `Append()` function is able to add an item to the end of a list, and you can use that to 'grow' a list one item at a time:

```
##I need ten items
```

```
items <- []
i <- 1
while(i <= 10)
{
  items <- Append(items,Random())
}
```

This idiom is used in many places in PEBL test batteries. However, it can be inefficient as the length of the list grows. This is because on each iteration, a new list is created that is 1 element longer than the previous list (and each element is copied to the new list). For small lists, even ones hundred of items long, this overhead is pretty small and you hardly notice. But as a list gets thousands of items long, this can start to slow things down, especially if you are doing something complex between each trial. As of PEBL 0.13, we support another function called `PushOnEnd()`:

```
items <- []
i <- 1
while(i <= 10)
{
  PushOnEnd(items,Random())
}
```

`PushOnEnd` will alter `items` directly, and do so in a very efficient way. Notice that you don't need to copy the new list and overwrite itself. However, for ease of use, `PushOnEnd()` returns the current copy of the list, and so you can often use it as a drop-in replacement for `Append` (in cases where you are throwing away the original list). In tests, this method appears to be only 5-10% less efficient than using `PushOnEnd` alone, and so it should hardly be noticed.

```
items <- []
i <- 1
while(i <= 10)
{
```

```
    items <- PushOnEnd(items,Random())
}
```

A caveat when using lists: Some functions operate on lists to produce new lists (sub-lists, re-ordered lists, etc.). When the lists contain simple data types (numbers, strings, etc.), entirely new data structures are created. But when the data structures are complex (windows, sounds, images, etc.), the objects are not copied. Only new pointers to the original objects are created. So if you change the original object, you may end up accidentally changing the new object. Although that is relatively difficult, because PEBL allows only limited modification of existing data structures, it is still possible. This is a special case of the copy/assignment issue discussed in Section 3.6.4: Copies and Assignment.

### 4.1.2 Recursion on lists

Many mathematical functions that take a single argument can be applied either to a number or a list of numbers. When applied to an entire list, it will return the function applied to each element of that list. For example, `Ln(1)` return 0, but `Ln([1,1,1])` returns `[0,0,0]`.

A list of functions that support this include:

- `Log10`      • `Log2`      • `Ln`      • `Exp`
- `Sqrt`      • `Tan`      • `Sin`      • `Cos`
- `ATan`      • `ASin`      • `ACos`      • `DegToRad`
- `RadToDeg`   • `Round`   • `Floor`   • `Ceiling`
- `AbsFloor`   • `Sign`      • `Abs`

In addition, a number of math functions that take two arguments will apply themselves recursively to the first argument should it be a list. For example, `LogN([1,1,1],5)` will return `[0,0,0]`. Functions that support this include:

- `LogN`   • `Pow`   • `NthRoot`

## 4.2 Fonts

PEBL uses truetype fonts for the display of text in labels and other text widgets. In addition to the filename, font objects have the following properties: style (i.e., normal, bold, italic, underline), size (in points), foreground color, background color, and whether it should be rendered anti-aliased.

We distribute a series of high-quality freely available and redistributable fonts, including the DejaVu series, freefont series, and a few others. These include the typeface/files shown below 1:

These should always be available for use in experiments. The `fonts.pbl` script in the `demo/` directory will display what symbols from each of these fonts looks like.

To use, you need only specify the font name in the `MakeFont()` function:

```
colorRed  <- MakeColor("red")
colorGrey <- MakeColor("grey")
myFont    <- MakeFont("VeraMono.ttf",0,22,colorRed,colorGrey,1)
```

This code makes a red 22-point anti-aliased font on a grey background. Other fonts may be used by specifying their absolute pathname or copying them to the working directory and using them.

Accessible font properties:

```
font.FILENAME
font.BOLD
font.UNDERLINE
font.ITALIC
font.SIZE
font.FGCOLOR
font.BGCOLOR
font.ANTIALIASED
```

Having the right fonts is important for translating PEBL scripts into new languages. Previously, this was challenging because the default font used in many scripts was Vera, and Vera has poor support for international characters. As of PEBL 0.11, a few things have changed to make international character support easier:

- Three new fonts that support international characters much better (“DejaVuSans.ttf”, “DejaVuSansMono.ttf”, and “DejaVuSerif.ttf”) are now included and available.
- Three new global variables are set on initiation: `gPEBLBaseFont`, `gPEBLBaseFontMono`, and `gPEBLBaseFontSerif`, which are set by default to these three font names.

Table 1: Typeface/Files Available in PEBL

Filename	Description
FreeFont Fonts	
FreeSans.ttf	Simple Clean sans serif font
FreeSansBold.ttf	
FreeSansOblique.ttf	
FreeSansBoldOblique.ttf	
FreeMono.ttf	Courier-like fontface
FreeMonoBold.ttf	
FreeMonoOblique.ttf	
FreeMonoBoldOblique.ttf	
FreeSerif.ttf	Similar to Times New Roman
FreeSerifBold.ttf	
FreeSerifItalic.ttf	
FreeSerifBoldItalic.ttf	
Fontforge Fonts	
Caliban.ttf	Helvetica-style
CaslonRoman.ttf	Quirky Roman Font series
CaslonBold.ttf	
CaslonItalic.ttf	
Caslon-Black.ttf	
Humanistic.ttf	Sharp, refined fontface
SIL Fonts	
DoulosSILR.ttf	Comprehensive font with roman and cyrillic glyphs
GenR102.ttf	
GenI102.ttf	Like doulos, optimized for printing
CharisSILR.ttf	
CharisSILB.ttf	
CharisSILI.ttf	
CharisSILBI.ttf	
PEBL Fonts	
Stimulasia.ttf	A small set of arrow/boxes
Bitstream Vera Series (Deprecated in favor of DejaVu)	
Vera.ttf	Sans serif Roman-style base font
VeraMono.ttf	Sans serif Roman-style mono-spaced base font
VeraSe.ttf	Serif Roman-style base font (similar to times)
VeraBd.ttf	Bold Vera
VeraIt.ttf	Italic Vera
VeraBI.ttf	Bold Italic Vera
VeraMoBd.ttf	Bold Vera Mono
VeraMoIt.ttf	Italic Vera Mono
VeraMoBI.ttf	Bold Italic Vera Mono
VeraSeBd.ttf	Bold Serif Vera
DejaVu Series (Version of Vera with international characters)	
DejaVuSerif.ttf	Serif Roman-style base font (similar to times)
DejaVuSans.ttf	Serif Roman-style base font
DejaVuSansMono.ttf	Sans serif Roman-style mono-spaced base font
28CJK Fonts	
wqy-zenhei.ttc	All-purpose font with support for Chinese, Korean and Japanese

- Helper functions and battery tests are all updated to use these values to set up fonts.

So now, many international characters will be handled by default. For character sets that aren't handled by DejaVu, simply needs to change `gPEBLBaseFont` to name a font that can handle your characters (and include that font in the program directory), and everything should work out fine.

### 4.3 Colors

Colors are PEBL objects. A color can be created by specifying its name using the `MakeColor()` function, or by specifying its RGB values using the `MakeColorRGB()` function. A list of colors and their respective RGB values can be found in the `Colors.txt` file in the documentation directory, or in the final chapter of the manual. There are nearly 800 from which to choose, so you can create just about anything you can imagine.

Accessible color properties:

```
color.RED  
color.GREEN  
color.BLUE  
color.ALPHA
```

### 4.4 Windows

To run an experiment, you usually need to create a window in which to display stimuli. This is done with the `MakeWindow()` function. `MakeWindow()` will create a grey window by default, or you can specify a color. Currently, an experiment can have only one window.

### 4.5 Graphical Widgets

Graphical “widgets” are the building blocks of experimental stimuli. Currently, four widgets are available: images, labels, canvasses, and textboxes. More complicated widgets are in progress or planned. There are also a number of shapes that in some ways behave like widgets, but are technically not.

To be used, a widget must be created and added to a parent window, and then the parent window must be drawn. You can hide widgets with the `Hide()` function, and show them with the `Show()` function; however, this affects only the visibility of the widget: it is still present and consuming memory. Widgets

can be moved around on the parent window using the `Move()` function. `Move()` moves the center of an image or label to the specified pixel, counting from the upper-left corner of the screen. `Move()` moves the upper left-hand corner of textboxes. For the sake of convenience, the `MoveCorner` function is available, which will move an image or label by its upper left-hand corner.

You should remove widgets from their parent window when you are finished using them.

All widgets have several properties available for controlling their behavior.

```
widget.name
widget.X
widget.Y
widget.WIDTH
widget.HEIGHT
widget.VISIBLE
widget.ROTATION
widget.ZOOMX
widget.ZOOMY
```

## 4.6 Images

PEBL can read numerous image types, courtesy of the `SDL_image` library. Use the `MakeImage()` function to read an image into an image object. As images are often used as stimuli, `Move()` centers the image on the specified point. To move by the upper-left hand corner, use the PEBL-defined `MoveCorner()` function:

```
define MoveCorner(object, x, y)
{
  size    <- GetSize(object)
  centerX <- x + First(size)/2
  centerY <- y + Last(size)/2
  Move(object, centerX, centerY)
}
```

Images have all the properties available for widgets, but the width and height can only be read, and not set. Width and height are controlled by the dimensions of the image file.

## 4.7 Canvases

A canvas is a blank rectangle, sort of like an 'imageless' image. As with an image,

`Move()` centers the image on the specified point. A canvas appears similar to a `Rectangle()` shape, but differs in some important ways. First, a Canvas has a piece of video memory associated with it—shapes do not. This means that other objects can be added to a canvas, just as it can be added to a window. If you move the canvas around, the attached objects will move with the canvas.

Second, individual pixels of a canvas can be set, using the `SetPoint()` function. `SetPoint` works on images too, but not on text. This is because a `Draw()` command re-renders text, and so will wipe out any pixel damage you have done. This can be useful for making special-purpose drawing functions to create stimuli, especially noise distributions.

Finally, a canvas can be drawn on with another object. In fact, you can use another image as a brush. Add an image to a canvas, and anytime you call `Draw()` on the canvas (rather than without an argument), the image gets imprinted on the canvas. This will remain until you call `ResetCanvas()`.

For example:

```
tb <- MakeCanvas(600,400,d)
AddObject(tb,win)

##add the image to canvas, not win
pebl <- MakeImage("pebl.png")
AddObject(pebl,tb)

##Nothing will appear on the screen in these intermediate draws
Move(pebl,100,100)
Draw(pebl)
Move(pebl,200,100)
Draw(pebl)
Move(pebl,200,200)
Draw(pebl)
Move(pebl,100,200)
Draw(pebl)

Draw() ##Now, we will see the canvas with 4 pebl images on it.
```

The draw-on trick can be used to add noise to a text stimulus. Make a label and add it to a canvas, use `Draw()` on the label, then hide the label, and add noise to the canvas by using `SetPoint()`. Anything drawn on the canvas won't get reset until the `ResetCanvas()` function is called.

Images have all the properties available for widgets. Size cannot be updated once the canvas is created.

Note that the background color can have an alpha value. If you use an alpha value of 0, the background will be invisible.

## 4.8 Shapes

PEBL allows you to define a number of shape objects that can be added to another widget. A demonstration script exercising these shapes is found in `demo/shapes.pbl`.

The following is a list of shape and their properties.

### 4.8.1 Circle

*Description:* A standard circle. Move commands move the center of the circle to the specified location.

*Command:* `Circle(<x>,<y>,<r>,<color>,<filled>)`

*Properties:* `.name`  
`.filled = 0,1` (whether it is filled)  
`.color` (color)  
`.x` (x position of center)  
`.y` (y position of center)  
`.height` (read-only height)  
`.width` (read-only width)  
`.R` (radius)

### 4.8.2 Ellipse

*Description:* An ellipse, with height and width differing. Cannot be pointed in an arbitrary direction. Move commands move the center of the shape to the specified location.

*Command:* `Ellipse(<x>,<y>,<rx>,<ry>,<color>,<filled>)`

*Properties:* `.name`  
`.filled = 0,1` (whether it is filled)  
`.color` (color)  
`.x` (x position of center)  
`.y` (y position of center)  
`.height` (read-only height)  
`.width` (read-only width)  
`.rx` (x radius)  
`.ry` (y radius)

### 4.8.3 Square

*Description:* A square. Move commands move the center of the shape to the specified location.

*Command:* `Square(<x>,<y>,<size>,<color>,<filled>)`

*Properties:*

`.name`  
`.filled` = 0,1 (whether it is filled)  
`.color` (color)  
`.x` (x position of center)  
`.y` (y position of center)  
`.height` (read-only height)  
`.width` (read-only width)  
`.dx`, `.dy`, `.size` (Length of side)

### 4.8.4 Rectangle

*Description:* A Rectangle. Move commands move the center of the rectangle to the specified location.

*Command:* `Rectangle(<x>,<y>,<dx>,<dy>,<color>,<filled>)`

*Properties:* `.name`

`.filled` = 0,1 (whether it is filled)  
`.color` (color)  
`.x` (x position of center)  
`.y` (y position of center)  
`.height` (read-only height)  
`.width` (read-only width)  
`.dx`, (width) `.dy`, (height)

### 4.8.5 Line

*Description:* A Line. Move commands move the center of the line to the specified location.

*Command:* `Line( <x>, <y>,<dx>,<dy>,<color>)`

*Properties:* `.color` (color)

`.x` (x position of start)

.y (y position of start)  
.width, (x length)  
.height, (y length)

#### 4.8.6 Polygon

*Description:* An arbitrary polygon.

*Command:* Polygon( <x>, <y>,<xpoints>,<ypoints>,<color>,<filled>)

*Properties:* .name  
.color (color)  
.x (x position of start)  
.y (y position of start)

#### 4.8.7 Bezier

*Description:* An arbitrary bezier curve.

*Command:* Bezier( <x>, <y>,<xpoints>,<ypoints>,<steps>,<color>)

*Properties:* .name  
.color (color)  
.x (x position of start)  
.y (y position of start)

## 4.9 Text Labels

You can create a text label object with the `MakeLabel()` function, which requires specifying a font, and the foreground and background colors. Labels are only a single line of text. Like images, when you move them, they center on the specified point.

The text inside a label can be extracted with `GetText()` and set with `SetText()`. When you change a text object, it will not appear until the next time you call a `Draw()` function.

Text labels have all the regular widget properties, plus:

```
label.TEXT  
label.FONT
```

The `.HEIGHT` and `.WIDTH` accessible, but cannot be changed because they are controlled by the text and the font size.

## 4.10 Text Boxes

A text box is a graphical widget that contains a body of text. Text automatically wraps when it is too long to fit on a single line. Like labels, the text inside a `TextBox` can be extracted with `GetText()` and set with `SetText()`. When a text object is changed, it rerenders immediately, but does not appear until the next time a `Draw()` function is called.

Textbox properties:

```
textbox.EDITABLE  
textbox.CURSORPOS  
textbox.DIRECTION  
textbox.LINEHEIGHT  
textbox.LINEWRAP
```

## 4.11 User-Editable Text Boxes

Text box editing can be performed using the `GetInput(<textbox>,<escape-key>)` function. This returns the text that is present in the box when the participant hits the key associated with `<escape-key>`. `<escape-key>` is just a text-based code that describes the keypress that should be checked for exit. Typical escape-key options include:

```
"<return>"
```

```
"<esc>"
"<backspace>"
"<kp_enter>"
" "
"A"
```

See the Keyboard Entry section below for a more complete list.

Translation from string to keyboard input is still crude, and is handled in `src/utility/PEBLUtility.cpp:TranslateString`

## 4.12 Audio

Currently, audio output is supported through a software mixer library, although there are no facilities for recording or analyzing audio input.

PEBL can load both raw and compressed audio files, including .wav, .mp3, .ogg, .flac, and .midi files, which are handled seamlessly with the `LoadSound()` function. This returns an audio stream object that can be played with either the `PlayForeground()` or `PlayBackground()` functions. The `PlayForeground()` function returns once the sound is finished playing; `PlayBackground()` returns immediately and the sound plays in a separate thread. When using `PlayBackground`, playing can be stopped using the `Stop()` function.

The volume of an audio sample can be manipulated using `SetPanning`. Here, each channel (left and right) volume is set independently, from 0 to 1.0. Also, the `SetPlayRepeats` will repeat playback a sound until stopped. This could be good for a signal that is played until a response is made.

## 4.13 Movie Files

As of 2.0, Playback of movies is not enabled.

If compiled to support them, PEBL can read numerous video and audio media files `waave` library and `ffmpeg`. Use the `LoadMovie()` function to read a movie file into a movie object. The `Move()` function moves the upper left corner of the movie to the specified point. An audio file can be similarly loaded using the `LoadAudioFile` function.

Movie playback is done via a handler placed in the event loop. This handler is placed there with the `StartPlayback` function. Then, when the event loop runs, the movie will get updated in proper time sequence. The event loop is used for most `WaitFor` type events. This allows you to play a movie and wait for a response at the same time. Alternately, a complete movie file can be played in full (with no possibility for stopping early) using the `PlayMovie()` function.

Movies have a number of properties that can be set to change playback or determine aspects of the movie. These are all accessible via `.property` syntax, and can be printed by the `PrintProperties` function. Properties include:

- `DURATION`: time in ms
- `FILENAME`: filename
- `HEIGHT`: pixels high
- `NAME`: <MOVIE>

- **PLAYBACKPOSITION**: where playback is
- **ROTATION**: Inherited; will not work
- **VISIBLE**: whether hidden or visible
- **VOLUME**: volume on a logarithmic scale—can go from 0 to +infinity
- **WIDTH**: screen width in pixels
- **X**: upper left corner x
- **Y**: upper left corner y
- **ZOOMX**: scaling; not used (just set width)
- **ZOOMY**: scaling; not used (just set height)

## 4.14 Custom objects

Along with the built-in objects, PEBL lets you create your own object with properties that can be added, changed, and accessed using the `.property` notation. With appropriate use of the `CallFunction` command, you can also specify function handlers for functions such as `Move()`, `Draw()`, `Inside()`, or whatever you want. The object system in PEBL is fairly (and intentionally) primitive, without things you might expect from full-fledged object-oriented languages (i.e., accessor functions, inheritance, methods, constructors, etc.). Nevertheless, it can be very useful for encapsulating a lot of information about a computing object, and is used heavily in the GUI objects found in the launcher and other PEBL tools.

Use `MakeCustomObject(name)` to create a custom object. Then, a property can be added by assigning `obj.name`. For example, suppose you want an object to represent the x,y location of a point.

```
p1 <- MakeCustomObject("point")
p1.x <- 100
p1.y <- 100
```

Now, if you want to use access the x and y properties, do:

```
Print("position is:" p1.x + "," + p1.y)
```

An object can take a function name as a property. For example:

```
p1.inside <- "InsidePoint"
```

With the function `InsidePoint` defined as:

```
define InsidePoint(x,y,p)
{
  return (x==p.x and y==p.y)
```

```
}
```

If you had a bunch of objects, you could define the `.inside` property of each differently. Then, later, you could define `InsideObject` to check any of them:

```
define InsideObject(x,y,p)
{
    CallFunction(p.inside,[x,y,p])
}
```

## 4.15 Keyboard Entry

PEBL can examine the state of the keyboard, and wait for various keyboard events to happen. Functions such as `WaitForKeyDown()`, `WaitForAnyKeyDown()`, etc., allow you to collect responses from subjects. Most keys are specified by their letter name; others have special names:

```
"<left>"
"<up>"
"<down>"
"<right>"
"<enter>"
"<return>"
"<esc>"
"<backspace>" or "<back>"
"<kp_0>" through "<kp_9>", as well as "<kp_period>", "<kp_divide>",
"<kp_multiply>", "<kp_minus>", "<kp_plus>", "<kp_equals>",
"<kp_enter>" for keypad keys.
```

"<insert>", "<delete>", "<home>", "<end>", "<pageup>", "<pagedown>" for other special keys.

Function keys "<F1>" through "<F15>".

Also, the traditional "modifier" keys can serve as normal keys:

```
<lshift>, <rshift> <numlock>, <capslock>, <scrollock>,
<rctrl>, <lctrl>, <ralt>, <lalt>, <rmeta>, <lmeta>, <lsuper>,
<rsuper>, <mode>, <compose>
```

## 4.16 Joystick Input

PEBL supports input with a joystick. In order to use a joystick, you first need to poll the computer to determine whether a joystick is attached, and create a

joystick object. The file `joysticktest.pbl` in the demo directory creates a simple visual depiction of a fairly standard gamepad.

A joystick will have up to four types of inputs on it: buttons, axes, hats, and balls. But different joysticks are different, and so you may need to do some checking and testing for your particular setup. PEBL currently does not support force-feedback or rumble functions available on some joysticks.

### Axes:

Each axis takes on a value between 1 and 32768. For a normal hand-grasp joystick, the first two axes will be determined by the relative x and y positions of the joystick. Gamepads often have triggers that are additional axes, or sometimes there are throttles (or gas/brake pedals in driving devices) that are mapped to axes. Find out how many axes exist with `GetNumJoystickAxes()`. Get the state of a particular axis with `GetJoystickAxisState()`.

### Hats:

Hats are the little 8-way buttons that control direction on many game pads. They are sort of a digital axis, because each state is absolute. The entire hat state takes on a single integer number between 0 and 15. It is binary coded to specify whether each of the four major axes buttons are depressed:

- left: 8
- bottom: 4
- right: 2
- top: 1

The mechanics of the hat allows two buttons to be pressed simultaneously, indicating, for example, southeast or northwest. An example of how to extract the bitwise button states is found in the `joysticktest.pbl` file.

### Buttons:

Usually, the state of each of the buttons on the joystick can be identified. Button state is coded so that 0=unpressed, 1=pressed. There can easily be a dozen or more buttons on a joystick, enabling some pretty elaborate response modes for experiments.

### Balls:

Balls are very rare; you may have seen them in old-style arcade games like Arkenoid. No consumer joysticks available today appear to have balls that operate this way, and they have not been tested in PEBL. If you want to support trackballs, there are plenty of trackball mice that work as normal joystick controllers.

A number of functions are available for creating a joystick object and polling the joystick's current state:

Summary of joystick functions:

```
GetNumJoysticks()
OpenJoystick()
GetNumJoystickAxes()
GetNumJoystickBalls()
GetNumJoystickButtons()
GetNumJoystickHats()
GetJoystickAxisState()
GetJoystickHatState()
GetJoystickButtonState()
```

Currently, the joystick state is not integrated into PEBL's event loop. Consequently, there are no functions such as `WaitForJoystickButton()`, and no way to create or monitor events. To use the joystick, you need to monitor the state of the device manually, and create a polling loop yourself, like:

```
##This will keep looping until you press the first button
js <- OpenJoystick(1) ##open the first joystick connected to the system
gCont <- 1
while (gCont)
{
  state <- GetJoystickAxisState(js,1)
  Print(state)
  ##Do something with the axis1 here

  gCont <- GetJoystickButtonState(1)
}
```

The file `demo/joysticktest.pbl` uses most of the available joystick functions to display a virtual gamepad on the screen as it captures input.

## 4.17 Files

Files are objects that can be read from or written to using several PEBL functions. To use a file object, create one using one of the functions listed below. Each function returns a file object:

```
FileOpenRead()  
FileOpenWrite()  
FileOpenOverwrite()  
FileOpenAppend()  
GetNewDataFile()  
ReadCSV()
```

For example, you can use the command:

```
myfile <- FileOpenRead("stimuli.txt")  
to create 'myfile', a readable file stream.
```

**FileOpenWrite** is made with a safety backup. It will never overwrite an existing file; instead it will create a new file name by appending a number (i.e. 1) to the end of the base file name. The new filename will be saved as in the `.filename` property of the resulting file. The function **FileOpenOverwrite()** will overwrite any existing files, and should not be used for data files when you have the chance for a collision in a subject code.

The function **GetNewDataFile()** offers another all-in-one path for creating a data file. It will take a base name and a subject identifier, a file extension, and a header. If the file has not previously been created, it will create the new file and add a header row. If it has been created before, it will ask you whether to append to the current data file (in which case it won't add a header row), or select a new data file. Data files are created in separated subdirectories (one per participant) within the data directory of the experiment.

Because some of the **FileOpen** commands will create a file with a name you didn't ask for (to avoid overwriting), a successfully opened file has a property `.filename` that provides the actual file name selected.

Other Functions described below allow filestreams to be written to or read from. When you are finished, you can close a filestream Using the '**FileClose()**' function.

A number of related functions have been created to help make reading and writing to files easier. For example, the following functions enable reading an entire file into either a string variant, a list (with one list item per row), or a table:

```
ReadCSV()  
FileReadCharacter()  
FileReadLine()  
FileReadWord()  
FileReadTable()  
FileReadText()
```

`FileReadList()`  
`FileExists()`

## 4.18 Network Connections

PEBL has limited ability to open and communicate via TCP/IP connections, either some other system (e.g., for synchronizing with an e.e.g. or eyetracking computer), or another computer running PEBL (e.g., to create multi-subject game theory experiments or to have an experimenter controlling the task from another computer.)

### 4.18.1 TCP/IP Overview

TCP/IP is a protocol by which computers can talk to one another. It is fairly barebones, and PEBL tries to hide much of its complexity. The information you send from one computer to another is guaranteed to arrive in the correct order, at the potential cost of serious delays, especially if the computers are on different networks or in different locations. Furthermore, connecting PEBL to another computer in this way is a potential security risk. However, the ability to transfer information between computers opens up huge potential for the types of experiments that can be constructed.

### 4.18.2 Addresses and Ports

To do this, you first must open a network object to communicate with another computer. To do this, you must know (1) the IP number (like 127.0.0.1) or hostname (like myname.myschool.edu) of the computer you want to connect to, and (2) the port you want to connect on. You can even use the protocol to connect to another program running on your own computer, by specifying an IP address of 127.0.0.1, or the hostname “localhost”. A port is a number—usually 2 to 5 digits, specifying a type of service on your computer. Many ports are frequently used for specific types of communication, but you can use any port you wish to communicate, as long as both computers know this port. Most ports on your computer should be blocked by default, so you may need to turn off your firewall or allow your chosen port to pass through the security or you may have trouble communicating.

To allow two PEBL programs to communicate, you need to decide that one computer is the “server” and the other is the “client”. On the server, you execute the function `WaitForNetworkConnection(port)`, which listens on the specified port until the client tries to connect. After the server is started, the client calls `ConnectToHost(hostname, port)` or `AcceptNetworkConnection(port)` `ConnectToIP(ipnum, port)`, depending upon whether you are using the hostname or ip address. Typically, ip numbers are specified by four three-digit

numbers separated by dots, like 196.168.0.1. This actually represents a 4-byte integer, and this 4-byte integer is what `ConnectToIP()` expects. To create that integer, use the function

`ConvertIPString(ipnum)`, which accepts an IP address specified in a string. So, you can use:

```
net <- ConnectToIP(ConvertIPString( "127.0.0.1"), 1234)
```

to create a connection to another program listening on port 1234 on your own computer. These functions all return a network object (e.g., `net`) that must be used in later communication.

### 4.18.3 Sending and Receiving Data

Once connected, the distinction between client and server essentially disappears. However, to communicate, one computer must send data with the `SendData(net, data)`, and the other must receive the data, using the `GetData(net, size)` function. PEBL can only send text strings, and you must know the length of the message you want to receive. More complex communication can be done by creating a set of PEBL functions that encapsulate messages into text strings with templated headers that specify the message length. Then, to receive a message, you first read the fixed-length header, determine how much more data needs to be read, then read in the rest of the data.

### 4.18.4 Closing networks

If you are using a network connection to synchronize timing of two computers, you probably want to close the network connection with `CloseNetworkConnection(net)` after you have synchronized, to avoid any extra overhead.

A simple example of an experiment that uses TCP/IP to communicate is the NIM game in `demo/nim.pbl`.

## 4.19 Parallel Port

Starting with Version 0.12, PEBL can send and receive information via a standard parallel (printer) port. These don't appear on many computers anymore, but you can still get them, and they are still important ways to interface with hardware devices such as EEG and MRI machines and homebrew button boxes. Currently, parallel port access is fairly limited to setting and getting the state of the 8 data bits. Parallel ports have a number of bits you can play with, but currently PEBL only supports the basic 8 data bits. Basically, you can set the state of the bits or read the state of the bits, which can either control things

like LEDs, or be impacted by making connections between the ground and the data bit.

If you have a parallel port, it is mapped to one of three ports: LPT1, LPT2, or LPTX. To initialize access to a port, you must call `OpenPPort` with the name of your port: "

```
port <- OpenPPort("LPT1")
```

Parallel ports have two modes, input and output. To read data in, it needs to be in input mode; to change the state of the bits, it needs to be in output mode. Set the state with `SetPPortMode(port,"<input>")` or `SetPPortMode(port,"<output>")`.

To access the state of a port, use `GetPPortState(port)`. It will return a string of "|" separated 1s and 0s, which specify the state of each of the 8 bits.

To set the state of the port, use `SetPPortState(port,state)`. state should be a list of 8 0s or 1s:

```
SetPPortState(port, [0,0,0,0,0,0,0,1])
```

The internal c++ parallel port classes have substantially more flexibility, and can be adapted to do more complex access of parallel ports.

### 4.20 Serial Port

A number of devices are supported via the `comport` (serial port) library. This can include newer USB devices that simulate a `comport`.

The following functions are relevant:

- `OpenCOMPort(portnum,baud,mode)`
- `COMPORTSENBYTE(port,message)`
- `COMPORTGETBYTE(port)`

The general process is to use `OpenComPort` to create the port, and then send and receive text strings from that port. These are sent one byte at a time. The mode argument is a 3-character string that specifies aspects of the mode (see Teunis van Beelen's `rs232` library at <http://www.teuniz.net/RS-232/>). The first character is the data bits (5,6,7 or 8), parity (n=none, e=even, o=odd), and the third is the stop bit (1 or 2 bits).

Within the demo directory, there is some basic code for communicating with the cedrus response box that uses these functions. In addition, that script provide a `NumToASCII()` function that can be useful in translating numbers to strings to communicate with a device.

## 4.21 The Event Loop

To assist in testing for multiple input events simultaneously, PEBL implements an event loop that will quickly scan multiple conditions and execute proper results whenever any one condition is met.

The event loop works by maintaining a list of triggers that can be satisfied by various conditions. The conditions typically specify a device or other data source to examine, such as the timer. On each cycle of the loop, all events are examined, and when any of them are satisfied, either a specified function will be executed, or the event loop will exit. Most of the timing and input functions use the event loop behind the scenes.

As of Version 0.12, simple means to program the event loop are available. Three functions include:

- **RegisterEvent()**. This allows you to specify a condition and a function name which executes whenever the condition is true.
- **StartEventLoop()**. This starts the event loop, with all available events.
- **ClearEventLoop()**. This clears out the event loop so other events can be used.

Note that because other functions, such as `Wait()`, use the event loop, you can pre-load extra events and start the event loop with one of these functions.

These are used in a number of test battery tasks. However, their use is currently somewhat experimental, and their names and arguments may change in the future, and so we will not provide a detailed description of their use here.

## 4.22 Parameter Setting

PEBL offers an interface to set a large set of experimental parameters from a text file. Furthermore, the PEBL launcher allows you to edit and save new parameter sets. This allows you to create common versions of a test that you call, without editing the PEBL script.

The PEBL parameter system is based on a custom object created with the **CreateParameters()** function. To use this, it requires you to set default parameters (in case the parameter file is not found or damaged). Create default parameters as a nested list containing property-value pairs. For example:

```
parameterpairs <- [ ["length",10],  
                    ["trialsperblock",15],  
                    ["numblocks",3]
```

If you want to override these values, create a text file (typically saved in the `params` folder with the extension `.par`) that contains comma-separated values `parname,value`, like this:

```
length,5
trialsperblock,25
numblocks,5
```

Then, create a parameter object using `CreateParameters`:

```
gParams <- CreateParameters(pairlist, filename)
```

Any values in the `.par` file will override the values in the default list. PEBL tries to convert text values to numbers, and the value will be a number whenever the round-trip from text-to-number-to-text does not change the original value. Thus, avoid using floating-point values for parameters, and you may need to write “0.1” instead of “.1” if you do.

The PEBL launcher offers a way to set parameters. To do so, it needs more information, including the default values and a description. It looks for a `.schema` file in the `params` folder with the same name as the experiment. This file uses the `|` character to separate field (this allows you to use commas in the description):

```
length|10|The number of words per trial
trialsperblock|15|Trials in each block
numblock|3|Number of blocks.
```

Notice that quotes are not used in these files. The values in this file are **ONLY** relevant to the PEBL launcher. These are used to reset the values in a `.par` file or tell the experiment what typical values are. They can differ from the default values in the `.pbl` file, but for clarity they should not.

### 4.23 Errors and Warnings

PEBL does a great deal of error-checking to ensure that your program will run. If you crash with a segmentation fault, this is an error and you should report it. When a fatal error or non-fatal warning occurs, PEBL attempts to identify the location in your input file that led to the warning. On Linux, the warning and this location are printed to the command-line upon exit; on MS Windows or if you are using the launcher on any platform, they are printed to the file `stderr.txt`. In addition, when a fatal error is signalled, a dialog box will appear that displays the main message, after which PEBL will shut down.

You can do error checking in your own scripts with the `SignalFatalError()` function. This is especially useful in combination with the functions testing the type of object passed into the function. To ensure proper processing and ease of debugging, test the format of an argument passed into a function:

```
define MyFunction(par)
{
  if(not IsList(par))
  {
    SignalFatalError("MyFunction passed a non-list variable.")
  }
  ##Do other stuff here
}
```

Sometimes, you want to exit a program at a specific point, but don't want the error message dialog box to appear. You can use the `ExitQuietly(<message>)` function to do this.

## 4.24 Paths and Path Searching

Numerous functions and objects open files on your computer to read in information such as graphics, sounds, fonts, program files, and text files. When you attempt to open a file, PEBL will search in a number of places, in this order:

- The (current) working directory
- The directory of each file specified in the command line arguments
- media/fonts
- media/sounds
- media/images
- media/text

You can also specify other paths to be searched by specifying them on the command line. Be sure to end the directory with whatever is appropriate for your platform, e.g. `'\'` on Microsoft Windows or `'/'` on Linux.

On OSX, as of version 0.12, the media/ directory is located within the Resources/ subdirectory of the application package.

## 4.25 Controlling the Video settings

As part of PEBL 2.0, PEBL now uses hardware-accelerated graphics subsystems that permit better and more accurate control of the video system. For the most part, this should operate transparently, but the aspects of the video system can be controlled both by command-line arguments and can be overridden within a script using special global variables. The launcher works by using command-line arguments, but these can always be overridden within a script.

For the most part, these global variables must be set before a `MakeWindow()` function is called. The video system has several distinct aspects:

#### 4.25.1 Screen resolution

By default, the window will open up the same size as the current window. However, you can specify a specific resolution using the pulldown menu of the launcher, which also allows you to specify a custom screen size. This is most useful if you are debugging or running on a multi-screen setup. Regardless of what the specified screen resolution specified in the launcher, the selected screen resolution will be specified using the `gVideoWidth` and `gVideoHeight` global parameters, stores the specified values in pixels.

#### 4.25.2 Fullscreen mode

When you are testing a script, you usually want it run in a window so you can more easily cancel the script or edit parameter values. When testing, you usually want to run in fullscreen mode because it will help prevent participants from trying to do other things on the computer. This is controlled with the `-fullscreen` and `-windowed` command line parameters, which is settable using the fullscreen checkbox in the launcher.

#### 4.25.3 Video drivers

Depending on the platform, different graphics drivers may be available. The launcher tries to determine the available drivers and gives options of these in a drivers pulldown menu. These will typically include `opengl` and `software`. On windows, a `direct3d` option should be available; on linux, `opengles` may be available as well. Depending on your operating system, drivers, and hardware, you may have more or less success with one or another of the available drivers. The software driver is a fallback that should work if hardware drivers are causing troubles. The `vsync` option will only be available on a hardware-accelerated driver, such as `opengl` and `direct3d`.

#### 4.25.4 Synchronize to vertical refresh signal (vsync)

For hardware-accelerated drivers, you are able to synchronize the `Draw()` functions to the blank between each screen refresh. On a typical 60-hz LCD screen, this means that the screen will refresh (roughly) every 16.67 ms. This is set within the launcher, which using the `-vsyncon` argument. It can be examined or overridden within a script by using the `gVSync` function (setting to 1 for on or 0 for off). This allows you to have very precise control over the timing of video stimuli.

When vsync is on, the `Draw()` command will block until the video update has happened. This gives you (typically) roughly 15 ms to perform any updating you need to do, but sometimes this is not enough, and you take care to record the presentation timing if you are relying on video display timing, to ensure you are getting the timing you are hoping for.

The test file in `demo/tests/testrefresh.pbl` will test the effective update frequency you are achieving with your current video settings.

### 4.25.5 Multiple windows

You can open multiple windows simply by calling the `MakeWindow()` function more than once. The window dimensions will be taken directly from the values of `gVideoWidth`

*Multiple Windows* PEBL can open multiple windows for testing. This can be useful if you want to have separate screens for a subject and an experimenter. You can open multiple windows by calling the `MakeWindow()` function more than once. If you do this, each window should be set to its own parameter. Any `Draw()` command will update both windows.

For example, you can open a new window in several ways:

```
gWin <- MakeWindow()
```

Creates a window with the default (black) background, with the screen size identical to `gVideoWidthxgVideoHeight`, which may have been specified either earlier in the script or by the launcher program.

```
gWin <- MakeWindow("Red")
```

This creates a window with a red background. Note that you can use any one of hundreds of color names available.

```
color <- MakeColor("white")
gWin <- MakeWindow(color)
```

This creates a window with a specified color object. This could allow you to reuse the color object, or use a custom RGB color with `MakeColorRGB()`.

```
gWin <- MakeColor("black",300,300)
```

Here, the dimensions of the window are optionally fed into the `MakeWindow()` function.

Support for multiple windows is currently experimental. For example, mouse and keyboard events don't currently tell you which window they occurred on, although this will be possible in the future.

Although the `gVideoWidth` and `gVideoHeight` global variables are still available, these won't necessarily match any particular window if you create a window with

the last method above. Thus, you can get the screen size of any window using the `.width` and `.height` arguments of the window.

## 4.26 StickyKeys

On Windows, there are several hidden control options that are useful for users with limited mobility or dexterity. These include stickykeys—for keys such as the shift key, control key, etc. clicking on them will latch them down (like shift-lock), so that they can be used without touching both keys at once. By default in many versions of Windows, clicking the left shift key five times in a row will bring up the dialog to turn on/off stickykeys.

Unfortunately, many of the PEBL tests use left/right shift keys as default manual entry keys. So, the first time you run a test, it will pop up the dialog in the middle of the test asking you whether you want to turn on stickykeys. If this happens, you should generally go to the control panel and turn this off.

As of 2.0, PEBL will disable this option. This means that if you want to use the left-shift shortcut to start stickykeys, you may be out of luck—especially within the test. There are ways to turn it back on again automatically, and future versions of PEBL may attempt to do this, but currently it turns off when PEBL runs.

## 4.27 Provided Media Files

PEBL comes with various media files that can be specified from any script without including the complete path. If a user's file has the same name, it will be loaded before the PEBL-provided version. Table 2 describes the files included.

**Table 2:** Media Files Provided with PEBL

Name	Description
<b>In 'media/fonts/':</b>	
Listing of fonts appears in Table 1	
<b>In 'media/images/':</b>	
pebl.bmp	Demonstration bitmap image
pebl.png	Demonstration PNG image
pebl2.png	PEBL2 logo

Name	Description
smiley-small.png	25x25 smiley face
frowney-small.png	25x25 frowney face
smiley-large.png	100x100 smiley face
frowney-large.png	100x100 frowney face
plus.png	A green plus sign
x.png	A red x sign, matching the red plus
<b>In ‘media/sounds/’:</b>	
buzz500ms.wav	A 500-ms buzzer
chirp1.wav	A chirp stimulus
boo.wav	A really bad booing sound
cheer.wav	A pretty lame cheering sound
beep.wav	A simple beep
boo.wav	Boo—useful for errors
cheer.wav	A cheer-useful for correct feedback
kaching.wav	Sound of a coin in a jar
knock.wav	simple knocking/click sound
0.wav through 9.wav	Recording of numerals, used in digit span and others
correct.wav	correct feedback
incorrect.wav	Incorrect feedback
H,R,N,K,X,Y,W.wav	Female voice letters for n-back
<b>In ‘media/text/’:</b>	
Consonants.txt	List of all consonants, both cases
Digits.txt	List of digits 0-9
DigitNames.txt	List of digit names
Letters.txt	All letters, both cases
Lowercase.txt	Lowercase letters
LowercaseConsonants.txt	Lowercase Consonants
LowercaseVowels.txt	Lowercase Vowels
Uppercase.txt	Uppercase Letters
UppercaseConsonants.txt	Uppercase Consonants
UppercaseVowels.txt	Uppercase Vowels
Vowels.txt	Vowels (both cases)

Additionally, the PEBL Project distributes a number of other media files separately from the base system. These are available for separate download on the pebl website (<http://pebl.sourceforge.net>), and include a set of images (including shapes and sorting-task cards), and a set of auditory recordings (including beeps, the digits 0-10, and a few other things).

## 4.28 Special Variables

There are a number of special variables that be set by PEBL, and can later be accessed by an experiment. These are described in table 3.

**Table 3:** Special Variables in PEBL

Name	Purpose
<code>gKeepLooping</code>	Controls continued execution in event loop (unused).
<code>gSleepEasy</code>	Sets 'busy-waiting' to be either on or off. Busy-waiting can improve timing, but is often not needed and pegs CPU.
<code>gVideoWidth</code>	The width in pixels of the display (set by default or command-line option). Changing this before calling <code>MakeWindow</code> will change display width, if that width is available.
<code>gVideoHeight</code>	The height in pixels of the display (set by default or command-line). Change this before using <code>MakeWindow()</code> to change the display height
<code>gVideoDepth</code>	The bit depth of the video.
<code>gSubNum</code>	A global variable set to whatever follows the <code>--s</code> or <code>--S</code> command-line argument. Defaults to "0".
<code>gScriptName</code>	Specifies the name on the window, and some printed output.
<code>gVSync</code>	Determines whether script should be run with vsync on
<code>gLanguage</code>	A global variable specified on the command line which can be used by a script to target a specific language. Defaults to 'en'.
<code>gQuote</code>	A quotation mark: ". Use it to add quotes in text.
<code>gClick</code>	[x,y] location last click in <code>WaitForClickOnTarget</code> .
<code>gPEBLBaseFont</code>	Name of the default font to use in helper functions and most battery tasks. By default, set to "DejaVuSans.ttf". Change to override.
<code>gPEBLBaseFontMono</code>	Name of the default mono-spaced font By default, it is set to "DejaVuSansMono.ttf".
<code>gPEBLBaseFontSerif</code>	Name of the default serif font. By default, it is set to "DejaVuSerif.ttf".

## Chapter 5

# Function Quick Reference

Table 1 lists the functions available for use with PEBL. Those that are unimplemented are noted as such. If you want the functionality of an unimplemented function, or want functionality not provided in any of these functions, contact us, or better yet, contribute to the PEBL project by implementing the function yourself.

**Table 1:** Function Quick Reference

Name	Arguments	Description
Math Functions		
Log10	<num>	Log base 10 of <num>
Log2	<num>	Log base 2 of <num>
Ln	<num>	Natural log of <num>
LogN	<num> <base>	Log base <base> of <num>
Exp	<pow>	$e$ to the power of <pow>
Pow	<num> <pow>	<num> to the power of <pow>
Sqrt	<num>	Square root of <num>
NthRoot	<num> <root>	<num> to the power of $1/\text{<root>}$
Tan	<deg>	Tangent of <deg> degrees
Sin	<deg>	Sine of <deg> degrees
Cos	<deg>	Cosine of <deg> degrees
ATan	<num>	Inverse Tan of <num>, in degrees
ASin	<num>	Inverse Sine of <num>, in degrees
ACos	<num>	Inverse Cosine of <num>, in degrees
DegToRad	<deg>	Converts degrees to radians
RadToDeg	<rad>	Converts radians to degrees
Round	<num>, <precision> (opt)	Rounds <num> to nearest integer, or optionally power of 1/ten precision.

Name	Arguments	Description
Floor	<num>	Rounds <num> down to the next integer
Ceiling	<num>	Rounds <num> up to the next integer
AbsFloor	<num>	Rounds <num> toward 0 to an integer
Mod	<num> <mod>	Returns <num> mod <mod> or remainder of <num>/<mod>
Div	<num> <mod>	Returns <code>round(&lt;num&gt;/&lt;mod&gt;)</code>
ToInteger	<num>	Rounds a number to an integer, and changes internal representation
ToFloat	<num>	Converts number to internal floating-point representation
ToNumber	<>	
ToString	<num>	Converts a numerical value to a string representation
Sign	<num>	Returns +1 or -1, depending on sign of argument
Abs	<num>	Returns the absolute value of the number
CumNormInv	<p>	Returns accurate numerical approximation of cumulative normal inverse.
NormalDensity	<x>	Returns density of standard normal distribution.
SDTDPrime	<hr>,<far>, <tol>(opt)	Computes SDT dprime.
SDTBeta	<hr>,<far>, <tol>(opt)	Computes SDT beta.
Order	<list>	Returns a list of integers representing the order of <list>
Rank	<list>	Returns integers representing the ranked indices of the numbers of<list>
Median	<list>	Returns the median value of the numbers in <list>
Min	<list>	Returns the smallest of <list>
Max	<list>	Returns the largest of <list>
Bound	<val>, <min>, <max>	Returns val, bounded by min and max.
StDev	<list>	Returns the standard dev of <list>
Sum	<list>	Returns the sum of the numbers in <list>
CumSum	<list-of-numbers>	Returns the cumulative sums of a set of numbers
VecSum	<list1>,<list2>	Returns the pairwise sums of two lists of numbers

Name	Arguments	Description
VecTimes	<list1>,<list2>	Returns the pairwise products of two lists of numbers
Median	<list>	Returns the median of a set of values
Quantile	<list> <num>	Returns the <num> quantile of the numbers in <list>
SummaryStats	<data>,<cond>	Returns statistics (cond, N, median, mean, sd) computed on data for each distinct value of <cond>
SeedRNG	<num>	Seeds the random number generator with <num> to reproduce a random sequence
RandomizeTimer	-	Seeds the RNG with the current time
Random	-	Returns a random number between 0 and 1
RandomDiscrete	<num>	Returns a random integer between 1 and <num>
RandomUniform	<num>	Returns a random floating-point number between 0 and <num>
RandomNormal	<mean> <stdev>	Returns a random number according to the standard normal distribution with <mean> and <stdev>
RandomExponential	<mean>	Returns a random number according to exponential distribution with mean <mean> (or decay 1/mean)
RandomLogistic	<p>	Returns a random number according to the logistic distribution with parameter <p>
RandomLogNormal	<median> <spread>	Returns a random number according to the log-normal distribution with parameters <median> and <spread>
RandomBinomial	<p> <n>	Returns a random number according to the Binomial distribution with probability <p> and repetitions <n>
RandomBernoulli	<p>	Returns 0 with probability (1-<p>) and 1 with probability <p>
ZoomPoints	<[xs,yy]>, <xzoom>, <yzoom>	Zooms a set of points in 2 directions
ReflectPoints	<[xs,yy]>	Reflects points on vertical axis
RotatePoints	<[xs,yy]>,<angle>	Rotates point <angle> degrees
GetAngle	<x>,<y>	Returns the angle in degrees of a vector.
Dist	<x1,y1>,<[x2,y2]>	Returns distance between two points.
ToRight	<p1,p2,p3>	Determines whether p3 is to the right of line p1p2

Name	Arguments	Description
GetAngle3	<a,b,c>	Gets angle abc.
SegmentsIntersect	<ax,ay, bx,by, cx,cy, dx,dy>	Determines whether line segment ab intersects cd.
NonOverlapLayout	<xmin,xmax, ymin,ymax, tol,num>	Creates a set of num points that don't overlap, but fails gracefully
LayoutGrid	<minx,maxx, miny,maxy, height,width, vertical>	Creates [x,y] pairs in a grid for graphical layout

Name	Arguments	Description
<b>File/Network/Device Functions</b>		
Print	<value>	Prints <value> to <code>stdout</code> , appending a new line afterwards. <code>stdout</code> is the console (in Linux) or the file <code>stdout.txt</code> (in Windows)
Print_	<value>	Prints <value> to <code>stdout</code> , without appending a newline afterwards
PrintList	<value>	Prints <list>, getting rid of '[' , ']' and ',' characters.
Format	<object> <size>	Prints a number with specified spaces by truncating or padding
ZeroPad	<number> <size>	Pads the beginning of a number with 0s so the number is size long
FileOpenRead	<filename>	Opens a filename, returning a stream to be used for reading information
FileOpenWrite	<filename>	Opens a filename, returning a stream that can be used for writing information. Creates new file if file already exists
FileOpenOverwrite	<filename>	Opens a filename, returning a stream that can be used for writing information. Overwrites if file already exists
FileOpenAppend	<filename>	Opens a filename, returning a stream that can be used for writing info. Appends if the file already exists, opens if file does not
FileClose	<filestream>	Closes a filestream variable. Pass the variable name, not the filename
FilePrint	<filestream> <value>	Like Print, but to a file.
FilePrint_	<filestream> <value>	Like Print_, but to a file.
FilePrintList	<file><list>	Prints <list> to <file>, getting rid of '[' , ']' and ',' characters.
FileReadCharacter	<filestream>	Reads and returns a single character from a filestream
FileReadWord	<filestream>	Reads and returns a 'word' from a file; the next connected stream of characters not including a ' ' or a newline. Will not read newline characters

Name	Arguments	Description
FileReadLine	<filestream>	Reads and returns a line from a file; all characters up until the next newline or the end of the file
FileReadList	<filename>	Given a filename, will open it, read in all the items into a list (one item per line), and close the file afterwards
FileReadTable	<filename>	Like FileReadList, but reads in tables.
GetNewDatafile	<opt-sep> <id-code>, <window>, <basename>, <extension>, <header>	Optionally, specify a token separator Opens a data file in subnum directory
ReadCSV	<filename>	Opens a csv file returning a table with its elements
FileReadText	<filename>	Reads all of the text in the file into a variable
EndOfLine	<filestream>	Returns true if at end of line
EndOfFile	<filestream>	Returns true if at the end of a file
GetDirectoryListing	<path>	Returns a list of all the files/subdirectories in a path
FileExists	<path>	Checks whether a file exists
IsDirectory	<path>	Checks whether a file is a directory
MakeDirectory	<path>,<dirname>	Creates a directory in path
AppendFile	<file1>,<file2>	Appends a file2 to file1
CopyFile	<file>,<newfile>	Makes a copy of a file
DeleteFile	<file1>	Deletes a file
ConnectToIP	<ip> <port>	Connects to a port on another computer, returning network object.
ConnectToHost	<hostname> <port>	Connects to a port on another computer, returning network object.
WaitForNetwork Connection	<port>	Listens on a port until another computer connects, returning a network object
CloseNetwork Connection	<network>	Closes network connection
SendData	<network> <datastring>	Sends a data string over connection.
GetData	<network> <length>	return a string from network connection
ConvertIPString	<ip-as-string>	Converts an ip-number-as-string to usable address
OpenNetworkListener	<port>	Opens a port for listening

Name	Arguments	Description
CheckForNetwork Connection	<network>	Checks for incoming connection
GetHTTPFile	<server>, <file>, <outputfile>	Gets and saves a file from a website
GetHTTPText	<server>, <file>	Gets a file from a website and saves it to a variable.
PostHTTP	<host>,<page>, <headers>, <content>	Post to a server form.
MD5Sum	<text>	Computes MD5 checksum on text
MD5File	<filename>	Computes MD5 Checksum on file.
WritePNG	<filename>, <object>	Makes a .png from a window or object
GetNumJoysticks	no argument	Determines how many joysticks are available
OpenJoystick	joystick_id	Gets a joystick object
GetNumJoystickAxes	joystick_object	Counts how many axes on a joystick
GetNumJoystickBalls	joystick_object	Counts how many balls on a joystick
GetNumJoystickButtons	joystick_object	Counts how many buttons on a joystick
GetNumJoystickHats	joystick_object	Counts how many hats on a joystick
GetJoystickAxisState	joystick_object, axis_id	Gets the state of a joystick axis
GetJoystickHatState	joystick_object, hat_id	Gets the state of a joystick hat
GetJoystickButtonState	joystick_object, button_id	Gets the state of a joystick button
GetJoystickBallState	joystick_object, ball_id	Gets the state of a joystick ball
OpenCOMPort	<portnum>, <baud>	Opens a serial (com) port
COMPortGetByte	<port>	Gets a byte from the comport
COMPortSendByte	<port>,<byte>	Sends a character to the comport
OpenPPort	<portname>	Opens parallel port
SetPPortMode	<port> <mode>	Sets parallel port mode (input/output)
SetPPortState	<port> <state>	Sets parallel port state
GetPPortState	<port>	Gets state of parallel port data bits
<b>Graphical Objects Functions</b>		
MakeWindow	<colorname> (opt), <width>(opt), <height>(opt)	Creates main window, in color named by argument, or grey if no argument is named
MakeImage	<filename>	Creates an image by reading in an image file (jpg, gif, png, bmp, etc.)

Name	Arguments	Description
MakeLabel	<text> <font>	Creates a single line of text filled with <text> written in font <font>
MakeTextBox	<text> <font> <width> <height>	Creates a sized box filled with <text> written in font <font>
MakeCanvas	<width>, <height>, <color>	Creates a blank canvas
ResetCanvas	<canvas>	to add objects to or draw on Resets a canvas to its background, erasing anything drawn on the canvas
EasyLabel	<text>      <x><y> <win><fontsize>	Creates a single line of text and adds it to win at <x><y>
EasyTextBox	<text> <x> <y> <win> <fontsize> <width> <height>	Creates a textbox and adds it to <win> at <x><y>
MakeColor	<colorname>	Creates a color based on a color name
MakeColorRGB	<red>      <green> <blue>	Creates a color based on red, green, and blue values
RGBToHSV	<color>	Converts a color to HSV triple
MakeFont	<ttf_filename> <style>      <size> <fgcolor> <bgcolor> <anti-aliased>	Creates a font which can be used to make labels
SetCursorPosition	<textbox> <position>	Move the editing cursor in a textbox
GetCursorPosition	<textbox>	Gets the position of the editing cursor
GetAbsolutePosition	<widget>	Gets the absolute window position of a widget
SetEditable	<textbox> <status>	Turns on or off the editing cursor
GetTextBoxCursor FromClick	<relx>, <rely>	Gets a cursor position (in characters) from a mouse click.
GetText	<textobject>	Returns the text in a textbox or label
GetInput	<textbox> <escape-key>	Allows a textbox to be edited by user, returning its text when <escape-key> is pressed.
SetText	<textobject>, <text>	Sets the text in a textbox or label
SetFont	<textobject>, <font>	Changes the font of a text object

Name	Arguments	Description
Move	<object> <x> <y>	Move an object (e.g., an image or a label to an x,y location)
MoveCorner	<object> <x> <y>	Moves an image or label by its upper corner.
GetSize	<object>	Returns a list of dimensions <x,y> of a graphical object.
GetLineBreaks	<textbox>	Computes the line breaks for a textbox text.
GetParent	<widget>	Gets the parent widget of a widget.
AddObject	<object> <parent>	Adds an object to a parent object (window)
RemoveObject	<object> <parent>	Removes an object from a parent window
RemoveObjects	<list-of-objects> <parent>	Removes a (possibly nested) list of objects from a parent window
Show	<object>	Shows an object
Hide	<object>	Hides an object
ShowCursor	<object>	Hides or show mouse cursor.
GetMouse		Gets [x,y] position of mouse
CursorPosition		
GetMouseState		Gets [x,y,b1,b2,b3] list of mouse state, including button states
SetMouse	<x>,<y>	Sets x,y position of mouse
CursorPosition		
Draw	<object> or no argument	Redraws a widget and its children
DrawFor	<object> <cycles>	Draws for exactly <cycles> cycles, then returns
Circle	<x> <y> <r> <color> <filled>	Creates circle with radius r centered at position x,y
Ellipse	<x> <y> <rx> <ry><color> <filled>	Creates ellipse with radii rx and ry centered at position x,y
Square	<x> <y> <size> <color> <filled>	Creates square with width size centered at position x,y
Rectangle	<x> <y> <dx> <dy><color> <filled>	Creates rectangle with size (dx, dy) centered at position x,y
Line	<x> <y> <dx> <dy> <color>	Creates line starting at x,y and ending at x+dx, y+dy
Polygon	<x> <y> <xpoints> <ypoints> <color><filled>	Creates polygon centered at x,y with relative points <xpoints>,<ypoints>

Name	Arguments	Description
Bezier	<x> <y> <xpoints> <ypoints> <steps> <color>	Creates bezier curve centered at x,y with relative points
BlockE	<x> <y> <h> <w> <thickness> <orientation> <color>	Creates a block E as a useable polygon which can be added to a window directly.
Plus	<x> <y> <size> <w> <color>	Creates a plus sign as a useable polygon which can be added to a window directly.
MakeStarPoints	<r_outer> <r_inner> <npeaks>	Creates points for a star, which can then be fed to Polygon
MakeNGonPoints	<radius> <npeaks>	Creates points for a polygon, which can then be fed to Polygon
ThickLine	<x1> <y1> <x2> <y2> <thickness> <color>	Creates a thick line between two points
MakeAttneave	<radius>, <numpoints>, <minangle>, <maxangle>	Makes a complex “Attneave” polygon
ConvexHull	<list-of-pts>	Returns a convex subset of points for a set
KaneszaSquare	<squaresize>, <circleradius>, <fg>, <bg>	Creates a 'Kanesza Square' stimulus.
KaneszaPolygon	<points>, <circTF>, <circleradius>, <fg>, <bg>,<show>	Create generic Kanesza polygon.
Inside	<[x,y]> <object>	Determines whether a point is inside a graphical object
SetPixel	x,y,color	Sets the color of a pixel on an image or canvas to color
SetPoint	x,y,color	Sets the color of a pixel on an image or canvas to color
GetPixelColor	<obj>,x,y	Gets the color of a specified pixel on a widget
MakeGabor	<size>, <freq>, <sd>, <angle>, <phase>, <bglev>	Creates a 'gabor patch' with specified parameters

Name	Arguments	Description
<b>Sound Objects Functions</b>		
LoadSound	<filename>	Loads a soundfile from the filename, returning a variable that can be played
PlayForeground	<sound>	Plays the sound 'in the foreground', not returning until the sound is complete
PlayBackground	<sound>	Plays the sound 'in the background', returning immediately
SetPanning	<sound>, +<left>+, +<right>+	Sets volume of left and right channel.
SetPlayRepeats	<sound>, +<reps>+	Sets a repeat count on a sound playback.
Stop	<sound>	Stops a sound playing in the background from playing
MakeSineWave	freq, duration, amplitude	Creates a pure sine wave.
MakeAudioInputBuffer	<time-in-ms>	Creates a buffer to record audio input
SaveAudioToWaveFile	<filename>, <buffer>	Saves buffer to a .wav file format
GetVocalResponseTime	<buffer>, <threshold>, <duration>	A simple voice key
LoadMovie	<movie_filename> <window>, <width>,<height>	Load a movie file
LoadAudioFile	<audio_filename>	Load an audio file
PlayMovie	<movie>	Plays a movie until its end
StartPlayback	<movie>	Initiates playback in background, updated with Wait()
PausePlayback	<movie>	Pauses playback of movie
<b>Graphical User Interface Functions</b>		
GetTime	<>	Gets a number, in milliseconds, representing the time since the PEBL program began running.
MakeButton	<label><x>,<y> <win>,<width>	Makes a button for clicking on.
PushButton	<button><[x,y]>	Pushes a button and releases.
MakeCheckBox	<label><x>,<y>, <win>,<width>	Makes a two-state checkbox on a button background.
ClickCheckBox	<checkbox><[x,y]>	Handles checkbox click and updates state.
SetCheckBox	<checkbox><state>	Sets checkbox state.

Name	Arguments	Description
MakeScrollingTextBox	<text>, <x>, <y>, <win>, <fontsize>, <width>, <height>, <linewidth>	Make a box for text that can be scrolled if too long.
SetScrollingText	<obj><text>, <linewidth>	Changes text of a scrolling textbox.
MakeScrollBar	<opts>, <header>, <x>, <y>, <win>, <fontsize>, <width>, <height>, <selected>	Make a scrolling selection box.
UpdateScrollBar	<obj>	Recalculates scrollbar layout.
DrawScrollBar	<obj>	Draws a scrollbar.
ClickOnScrollBar	<obj>, <click>	Handles click on scrollbar.
PopUpMessageBox	<label><win>	Makes a small message box at the mouse location.
PopUpEntryBox	<label><win><[x,y]>	Makes a small entry box at [xy] location.
MakePullDown	<optionlist>, <x>, <y>, <win>, <fontsize>, <width>, <selected>	Make a pulldown selection box for a list.
PullDown	<obj><[x,y]>	Handle click on a pulldown.
UpdatePullDown	<obj>, <newlist>	Updates the list of a pulldown.
DrawPullDown	<obj>	Redraws a pulldown if state changes.
MakeTextlist	<list>, <listoffset>, <prebuffer>	Creates a text body from a list.
InsideTB	<[xy]><obj>	Determine inside for a textbox-style object (location is upper left)
MakeMenu	<header>, <x>, <y>, <win>, <fontsize>, <width>, <subitems>, <functions>	Creates menu with suboptions.

Name	Arguments	Description
MakeMenuItem	<text>, <x>, <y>, <win>, <fontsize>, <width>, <function>	Creates menu sub-item.
ClickOnMenu	<obj>, <[x,y]>	Handles menu click, calling the .clickon function of menu.
OpenSubMenus	<obj>, <[x,y]>	Opens the sub-menus of a menu.

#### Custom and Built-in Object Functions

VariableExists	<variable-name>	Tests whether a variable exists.
PrintProperties	<object>	Prints a list of all available properties of an object (for debugging)
GetPropertyList	<object>	Gets a list of all the property names of an object
PropertyExists	<object> <prop>	Determines whether a particular property exists
SetProperty	<object> <prop> <value>	Sets property of an object
GetProperty	<object> <prop>	Returns value of property
MakeCustomObject	<name>	Creates custom object.
IsCustomObject	<object>	Tests whether object is a custom object.
DrawObject	obj	Calls the .draw property of an object
MoveObject	obj, x, y	Calls the .move property of an object
Clickon	obj, [x,y]	Calls the .clickon property of an object

#### Misc Event Functions

GetTime	<>	Gets a number, in milliseconds, representing the time since the PEBL program began running.
Wait	<time>	Pauses execution for <time> ms
IsKeyDown	<keyval>	Determines whether the key associated with <keyval> is down
IsKeyUp	<keyval>	Determines whether the key associated with <keyval> is up
IsAnyKeyDown	<>	Determines whether any key is down.
WaitForKeyDown	<keyval>	Waits until <keyval> is detected to be in the down state
WaitForAnyKeyDown	<>	Waits until any key is detected in down state
WaitForKeyUp	<keyval>	Waits until <keyval> is in up state.
WaitForAllKeysUp		Waits until all keys are in up state

Name	Arguments	Description
WaitForAnyKeyDown WithTimeout	<time>	Waits for a key to be pressed, but only for<time> ms
WaitForKeyListDown	<list-of-keyvals>	Waits until one of the keys is in down state
WaitForKeyPress	<key>	Waits until <key> is pressed
WaitForAnyKeyPress	<>	Waits until any key is pressed
WaitForKeyRelease	<key>	Waits until <key> is released
WaitForListKeyPress	<list-of-keys>	Waits until one of <list-of-keys> is pressed
WaitForListKeyPress WithTimeout	<list-of-keyvals> <timeout>	Waits for either a key to be pressed or a time to pass.
WaitForMouseButton		Waits until any of the mouse buttons is pressed or released, and returns message indicating what happened
WaitForMouseClicked WithTimeout	<timeout>	Waits until any of the mouse buttons is pressed, or a prespecified timeout has elapsed.
WaitForClickOnTarget	<target>	Waits until any of a set of target objects are clicked.
WaitForClickOnTarget WithTimeout	<target>, <timeout>	Waits with a max time for a set of targets to be clicked.
WaitForDownClick		Waits for mouse button to be clicked
RegisterEvent	<>	Registers events to trigger based on particular conditions
StartEventLoop	<>	Starts the event loop
ClearEventLoop	<>	Clears all trigger events from event loop
SignalFatalError	<message>	Halts execution, printing out message
ExitQuietly	<message>	Halts execution, printing a message to terminal but not a pop-up
TranslateKeyCode	<>	Converts a keycode to a key name
TimeStamp		Returns a string containing the current date and time
GetPEBLVersion	<>	Returns a string indicating which version of PEBL you are using
GetSystemType	<>	Identifies the type of operating system being used.
CopyToClipboard	<text>	Puts argument in system clipboard.
CopyFromClipboard	<>	Copies text from system clipboard.
GetVideoModes	opt:<screen>	Gets list of available screen resolutions
GetDrivers		Gets a list of possible video drivers
GetCurrent ScreenResolution	<>	Gets the current widthxheight of the screen

Name	Arguments	Description
SystemCall	<command> <optional-args>	Executes command in operating system
LaunchFile	<file>	Launches a file using platform-specific handlers
GetNIMHDemographics	<code> <window> <file>	Asks NIMH-related questions
GetSubNum	<window>	Asks user to enter subject number
MessageBox	<text> <win>	Pops up a message, overtop the entire screen, and waits for a click to continue.
GetEasyInput	<text> <win>	Gets typed input based on a prompt.
GetEasyChoice	<text>, <choices>, <output>, <window>	Simple multiple choice
GetEasyMultiChoice	<text>, <choices>, <output>, <window>, <min>(opt), <max>(opt)	Simple select-multiple choice
CountDown	<window>, <bg>(opt)	Displays a 3 2 1 countdown on screen
IsAudioOut	<variant>	Tests whether <variant> is a AudioOut stream
IsCanvas	<variant>	Tests whether <variant> is a Canvas
IsColor	<variant>	Tests whether <variant> is a Color
IsFileStream	<variant>	Tests whether <variant> is a FileStream
IsFloat	<variant>	Tests whether <variant> is a floating-point number
IsFont	<variant>	Tests whether <variant> is a Font
IsImage	<variant>	Tests whether <variant> is an Image
IsInteger	<variant>	Tests whether <variant> is an integer-type number
IsLabel	<variant>	Tests whether <variant> is a Text Label
IsList	<variant>	Tests whether <variant> is a List
IsNumber	<variant>	Tests whether <variant> is a number
IsTextBox	<variant>	Tests whether <variant> is a TextBox
IsText	<variant>	Tests whether <variant> is a text string

Name	Arguments	Description
IsShape	<variant>	Tests whether <variant> is any drawing shape, such as a circle, square or polygon
IsString	<variant>	Tests whether <variant> is a string
IsWidget	<variant>	Tests whether <variant> is any Widget
IsWindow	<variant>	Tests whether <variant> is any Window

#### List Manipulation Functions

Shuffle	<list>	Returns a new list with the items in list shuffled randomly.
ShuffleRepeat	<list> <times>	Generates a list of n shuffled versions of <list>
ShuffleWithout Adjacents	<nested-list>	Shuffle specifying items that should not appear adjacently
Repeat	<item> <n>	Repeats an item n times in a list
RepeatList	<list> <n>	Makes a new list containing the elements of <list> repeated <n> times
Sequence	<start> <end> <step>	Makes a sequence of numbers from <start> to <end>, with <step>-sized increments
ChooseN	<list> <n>	Returns a sublist of <n> items from a list, in the order they appear in the original list
Sample	<list>	Picks a single item randomly from <list>.
SampleN	<list> <n>	Returns a randomly-ordered sublist of <n> items from a list
SampleN WithReplacement	<list> <n>	Returns a sublist of <n> items from a list
DesignLatinSquare	<list1> <list2>	Simple latin square
LatinSquare	<list>	A simple latin square constructor
DesignGreco LatinSquare	<list1> <list2> <list3>	Create design
DesignBalanced Sampling	<list> <number>	Sample equally from list
DesignFull Counterbalance	<list1> <list2>	Create all combinations
CrossFactorWith outDuplicats	<list>	Returns a list of all pairs of items in the list, excluding pairs that where an element appears twice.
Rotate	<list> <n>	Rotates a list by <n> items.

Name	Arguments	Description
FoldList	<list> <n>	Folds list into length-n sublists.
Flatten	<list>	Flattens a nested list completely
FlattenN	<list> <n>	Flattens n levels of a nested list
Length	<list>	Returns the number of elements in a list.
First	<list>	Returns the first item in a list.
Last	<list>	Returns the last item in a list.
Merge	<list1> <list2>	Combines two lists.
Append	<list> <item>	Returns new list combining <list> and <item>
PushOnEnd	<list> <item>	Adds <item> to <list> efficiently
List	<item1> <item2>...	Makes a list out of items
Sort	<list>	Sorts a list by its values.
SortBy	<list> <key>	Sorts list by the values in <key>
Nth	<list> <n>	Returns the nth item in a list.
Subset	<list> <list-of-indices>	returns a subset of items from a list
SetElement	<list>, <index>, <value>	Sets an element of list to value
Match	[list],<item>	Returns a list of 0/1s, indicating which elements of list match item.
Filter	[list], <indicators>	Filters a list based on a 0/1 list produced by Match.
Levels	[list]	Returns a sorted list of unique elements in list.
Rest	<list>	Returns a list minus its first element
ExtractListItems	<list> <list-of-indices>	Gets a subset of items from a list
IsMember	<item> <list>	Checks whether <item> is a member of <list>
Replace	<template> <replacementList>	Replaces items in a data structure
Lookup	<key> <keylist> <database>	returns element in <database> corresponding to element of <keylist> that matches <key>.
Transpose	<list-of-lists>	Transposes a list of equal-length lists.
SubList	<list> <start> <finish>	Returns a sublist of a list.
RemoveSubset	<list> <list-of-pos>	Removes items at positions <list-of-pos> from a list.
ConcatenateList	<list>, <sep>(opt)	Combines list
ListToString	<list>, <list>,	

Name	Arguments	Description
ModList	<sep> (opt), <prebuffer>(opt)	Concatenates all elements of a list into a single string
Insert	<list>, <pre>, <post>	Adds pre- and post- elements to each list member
ListBy	<list>,<item>,<pos> <list>,<conds>	Inserts <item> into <list> at <pos> Segments a list into sublist by the values of a second list

#### String Management Functions

CR	<num>	Returns string with <num> linefeeds.
Tab	<num>	Returns string with <num> tabs.
Format	<value> <num>	Makes string from value exactly <num> characters by truncating or padding.
Enquote	<text>	Returns string surrounded by quote marks.
Uppercase	<string>	Returns uppercased string
Lowercase	<string>	Returns lowercased string
ReplaceChar	<string> <char> <char2>	Substitutes <char2> for <char> in <string>.
SubstituteStrings	<text>,<replist>	Makes multiple substitutions in text
SplitString	<string> <split>	Splits <string> into a list of <split>-delimited substrings
SplitStringSlow	<string> <split>	Splits <string> into a list of <split>-delimited substrings
StringLength	<string>	Returns the length of a string
SubString	<string> <position> <length>	Returns a substring
FindInString	<string> <key> <pos>	Returns position of <key> in <string>, starting at position <pos>
StripSpace	<string>	Strips whitespace from the start and end of <string>.
StripQuotes	<string>	Strips quotation marks from the start and end of <string>.

## Chapter 6

# The PEBL Layout & Response System

### 6.1 Overview

The PEBL Layout & Response System provides a unified interface for creating structured experimental layouts with automatic screen scaling and platform-aware response handling. This system simplifies the creation of battery tasks by providing:

- **Zone-based layouts** with automatic positioning and scaling
- **Platform-aware response modes** (keyboard, mouse, touch)
- **Single-function API** with intelligent defaults
- **Theme support** and accessibility features
- **Integration** with parameters, translations, and data upload

### 6.2 Quick Start

The simplest way to use the Layout & Response System is with two function calls:

```
define Start(p)
{
  gWin <- MakeWindow("black")
```

```
gParams <- CreateParameters(parpairs, gParamFile)

## Create layout with response system
gLayout <- CreateLayout("mytask", gWin, gParams)

## Set zone content
gLayout.header.text <- "My Task - Trial 1"
gLayout.footer.text <- "Press a response key"

Draw()

## Wait for response (returns "left" or "right")
response <- WaitForLayoutResponse(gLayout, 5000)

Print("Response: " + response)
}
```

This creates a full-screen layout with five zones (header, subheader, stimulus, response, footer) and handles both keyboard and mouse responses automatically based on the platform.

## 6.3 Layout Zones

The layout system divides the screen into five configurable zones:

### 6.3.1 Zone Structure

- **Header Zone** - Title and primary information (default: 50px height, 28pt font)
- **Subheader Zone** - Trial counter, status (default: 25px height, 18pt font, optional)
- **Stimulus Zone** - Main content area (flexible height, takes remaining space)
- **Response Zone** - Response key/target labels (default: 50px height, 20pt font)
- **Footer Zone** - Instructions, prompts (default: 50px height, 16pt font)

All zones scale proportionally based on screen resolution. The default baseline is 800x600, with all dimensions scaling up or down to match the actual screen size.

### 6.3.2 Accessing Zones

Zone labels are accessed as properties of the layout object:

```
gLayout.header.text <- "Trial " + trial
gLayout.subheader.text <- "Block " + block
gLayout.footer.text <- "Press LEFT or RIGHT"
```

```
## Control visibility
gLayout.header.visible <- 1 ## show
gLayout.subheader.visible <- 0 ## hide
```

### 6.3.3 Stimulus Region

The stimulus region is the flexible area where experimental stimuli are presented:

```
## Center of stimulus region
centerX <- gLayout.stimulusRegion.centerX
centerY <- gLayout.stimulusRegion.centerY

## Add stimuli
stim <- Circle(centerX, centerY, 50, MakeColor("red"), 1)
AddObject(stim, gWin)
```

The stimulus region automatically adjusts its size based on which zones are visible and the current screen dimensions.

## 6.4 Response Modes

The Layout & Response System supports multiple response modes that can be selected via parameters:

### 6.4.1 Keyboard Modes

**keyboardShift** - Left/right shift keys (native platforms only)

- **Keys:** Left Shift, Right Shift
- **Labels:** "LEFT-SHIFT", "RIGHT-SHIFT"
- **Platform:** Native only (avoids Windows Sticky Keys dialog)
- **Use case:** Traditional two-alternative tasks on desktop

**keyboardSafe** - Browser-safe letter keys

- **Keys:** Z, / (slash)

- **Labels:** "Z", "/"
- **Platform:** All (default for Emscripten/browser)
- **Use case:** Web-based experiments, avoids modifier key issues

### 6.4.2 Mouse Modes

**mousetarget** - Click on labeled targets

- **Target:** Clickable response zone labels
- **Labels:** "Click LEFT", "Click RIGHT"
- **Platform:** All
- **Use case:** Touch screens, tablets, mouse-based interfaces

**mousebutton** - Left/right mouse buttons

- **Buttons:** Left button (1), Right button (3)
- **Labels:** "LEFT-CLICK", "RIGHT-CLICK"
- **Platform:** All
- **Use case:** Tasks requiring fast mouse-based responses

### 6.4.3 Platform-Aware Selection

When **responsemode** is set to "auto" (the default), the system automatically selects:

- **Native platforms** (Linux, macOS, Windows): keyboardShift
- **Emscripten/Browser:** keyboardSafe

This ensures optimal performance and user experience across platforms.

## 6.5 Parameter Integration

The Layout & Response System integrates with PEBL's parameter management system. The most important parameter is **responsemode**, which determines how participants respond.

### 6.5.1 Basic Usage

Pass parameters to the layout to control response mode:

```
define Start(p)
{
  ## Define parameters including responsemode
  parpairs <- [
    ["responsemode", "auto"], ## Platform-aware by default
    ["numTrials", 20]
  ]

  ## Load parameters
  gParams <- CreateParameters(parpairs, gParamFile)

  ## Pass to layout (reads gParams.responsemode)
  gLayout <- CreateLayout("taskname", gWin, gParams)
}
```

### 6.5.2 Response Mode Parameter

The `responsemode` parameter accepts:

- "auto" - Platform-aware (keyboardShift on native, keyboardSafe on web)
- "keyboardShift" - Left/right shift keys
- "keyboardSafe" - Z and / keys (browser-safe)
- "mousetarget" - Click on labeled targets
- "mousebutton" - Left/right mouse buttons

For complete details on parameters, schemas, presets, and remote loading, see Chapter 7.

## 6.6 Translation Support

The Layout & Response System integrates with PEBL's translation system for multilingual support.

### 6.6.1 Basic Usage

Load translations and use them in layout zones:

```
define Start(p)
{
  ## Load translations for current language
  gStrings <- GetTranslations("taskname", gLanguage)
```

```
## Use translated strings in layout zones
gLayout.header.text <- gStrings.HEADER_TITLE
gLayout.footer.text <- gStrings.INSTRUCTIONS

Draw()
}
```

### 6.6.2 Running in Different Languages

```
## English (default)
pebl2 taskname.pbl

## Spanish
pebl2 taskname.pbl -v language=es

## French
pebl2 taskname.pbl -v language=fr
```

For complete details on translation file structure, special characters, creating translations, and best practices, see Chapter 7.

## 6.7 Data Upload Integration

Tasks using the Layout & Response System can integrate with PEBL's data upload functionality to provide feedback during upload.

### 6.7.1 Basic Usage

Use layout zones to show upload status:

```
define Start(p)
{
  ## ... run experiment ...

  FileClose(gFileOut)

  ## Upload with status display
  if(gParams.uploadData)
  {
    ## Show upload screen
    gLayout.header.text <- "Uploading Data"
    gLayout.footer.text <- "Please wait..."
    Draw()
  }
}
```

```
## Upload file
success <- UploadFile(gSubNum, gFileOut)

## Show result
if(success)
{
  gLayout.footer.text <- "Upload complete!"
} else {
  gLayout.footer.text <- "Upload failed. Data saved locally."
}

Draw()
Wait(2000)
}
}
```

The layout system provides a clean way to show upload progress and results without requiring popup dialogs.

**For complete details on data upload configuration, server setup (PEBL Simple Data Server and PEBLHub), and best practices, see Chapter 7.**

## 6.8 Layout Customization

The Layout & Response System can be customized per-task or globally.

### 6.8.1 Custom Layout Configuration

Create a custom layout file `battery/taskname/layout/taskname.pbl.layout.json`:

```
{
  "name": "Custom Task Layout",
  "version": "1.0",
  "baseline": {
    "width": 800,
    "height": 600
  },
  "margins": {
    "x": 25,
    "y": 25,
    "bottomReserve": 25
  },
  "zones": {
    "header": {
```

```
    "height": 60,
    "fontSize": 32,
    "visible": true
  },
  "subheader": {
    "height": 30,
    "fontSize": 20,
    "visible": true
  },
  "stimulus": {
    "flexGrow": true,
    "fontSize": 24
  },
  "response": {
    "height": 70,
    "fontSize": 24,
    "visible": true
  },
  "footer": {
    "height": 60,
    "fontSize": 18,
    "visible": true
  }
},
"responseDefaults": {
  "type": "auto",
  "numAlternatives": 2
}
}
```

### 6.8.2 Modifying Global Defaults

To change the default layout for all tasks, edit:

media/settings/default-layout.json

Changes to the default layout affect all tasks that don't have a custom layout configuration.

## 6.9 Complete Example

Here is a complete example demonstrating all features:

```
define Start(p)
```

```
{
##-----
## 1. SETUP
##-----
gScriptname <- "My Task"

## Parameters
parpairs <- [
  ["numPracticeTrials", 5],
  ["numTestTrials", 20],
  ["responsemode", "keyboardShift"],
  ["uploadData", 0],
  ["uploadURL", ""]
]
gParams <- CreateParameters(parpairs, gParamFile)

## Window and subject
gWin <- MakeWindow("black")
if(gSubNum+"" == "0") {
  gSubNum <- GetSubNum(gWin)
}

## Load translations
gStrings <- GetTranslations("mytask", gLanguage)

##-----
## 2. CREATE LAYOUT
##-----
gLayout <- CreateLayout("mytask", gWin, gParams)

## Configure zones
gLayout.header.text <- gStrings.TITLE
gLayout.footer.text <- gStrings.INSTRUCTIONS

##-----
## 3. DATA FILE
##-----
gFileOut <- GetNewDataFile(gSubNum, gWin, "mytask", "csv",
  "subnum,trial,phase,stimulus,response,correct,rt,timestamp")

##-----
## 4. PRACTICE TRIALS
##-----
gLayout.subheader.text <- "PRACTICE"
Draw()
WaitForAnyKeyPress()
}
```

```
loop(trial, Sequence(1, gParams.numPracticeTrials, 1))
{
  result <- RunTrial("practice", trial)
  FilePrint(gFileOut, result)
}

##-----
## 5. TEST TRIALS
##-----
gLayout.subheader.text <- "TEST"
gLayout.footer.text <- gStrings.TEST_INSTRUCTIONS
Draw()
WaitForAnyKeyPress()

loop(trial, Sequence(1, gParams.numTestTrials, 1))
{
  result <- RunTrial("test", trial)
  FilePrint(gFileOut, result)
}

##-----
## 6. UPLOAD & DEBRIEF
##-----
FileClose(gFileOut)

if(gParams.uploadData and gParams.uploadURL != "")
{
  UploadFile(gFileOut, gParams.uploadURL)
}

gLayout.header.text <- gStrings.COMPLETE
gLayout.subheader.visible <- 0
gLayout.footer.text <- gStrings.DEBRIEF
Draw()
Wait(3000)
}

define RunTrial(phase, trialNum)
{
  ## Update display
  gLayout.header.text <- gStrings.TITLE + " - Trial " + trialNum

  ## Show stimulus
  stim <- Circle(gLayout.stimulusRegion.centerX,
                 gLayout.stimulusRegion.centerY,
```

```
        50, MakeColor("red"), 1)
AddObject(stim, gWin)
Draw()

## Collect response
startTime <- GetTime()
response <- WaitForLayoutResponse(gLayout, 5000)
rt <- GetTime() - startTime

## Clean up
RemoveObject(stim, gWin)

## Return data
return(gSubNum + "," + trialNum + "," + phase +
      ",red_circle," + response + ",,+ rt + "," + TimeStamp())
}
```

## 6.10 Best Practices

### 6.10.1 Layout Usage

- Use `CreateLayout()` once at the start of your experiment
- Store the result in `gLayout` for global access
- Update zone text as needed, don't recreate the layout
- Use `Draw()` after updating zone content

### 6.10.2 Response Handling

- Always pass `gParams` to `CreateLayout()` for response mode support
- Use semantic responses ("left", "right") not raw keys in your logic
- Handle timeout cases (`response == "<timeout>"`)
- Provide clear instructions that match the response mode

### 6.10.3 Parameters

- Always provide a schema file with descriptions and defaults
- Use descriptive parameter names (not single letters)
- Create preset JSON files for common configurations
- Document parameter options in the schema

### 6.10.4 Translations

- Use UPPERCASE keys by convention
- Include all participant-visible text
- Test with at least two languages
- Provide English (`-en.json`) as the default

## 6.11 Reference

### 6.11.1 Core Functions

#### **CreateLayout(testName, win, params)**

Creates a layout with zones, response labels, and scaling.

- **testName**: Name of your task (string)
- **win**: Window object from `MakeWindow()`
- **params**: Parameter object with `.responsemode` (optional)
- **Returns**: Layout object (also sets `gLayout` global)

#### **WaitForLayoutResponse(layout, timeout)**

Waits for a response according to the layout's response mode.

- **layout**: Layout object from `CreateLayout()`
- **timeout**: Maximum wait in milliseconds (default: 60000)
- **Returns**: Semantic response ("left", "right", etc.) or "<timeout>"

### 6.11.2 Layout Properties

- `layout.header.text` - Header text
- `layout.header.visible` - Header visibility (0/1)
- `layout.subheader.text` - Subheader text
- `layout.subheader.visible` - Subheader visibility (0/1)
- `layout.footer.text` - Footer text
- `layout.footer.visible` - Footer visibility (0/1)
- `layout.stimulusRegion.centerX` - Stimulus area center X
- `layout.stimulusRegion.centerY` - Stimulus area center Y
- `layout.stimulusRegion.width` - Stimulus area width
- `layout.stimulusRegion.height` - Stimulus area height
- `layout.responseLabels` - List of response label objects
- `layout.responseMode.type` - Current response mode type

### 6.11.3 Default Configuration

The default layout configuration (800x600 baseline) includes:

- Margins: 25px (x and y)
- Bottom reserve: 25px (no-go zone for windowed mode)
- Header: 50px height, 28pt font
- Subheader: 25px height, 18pt font (visible by default)
- Response: 50px height, 20pt font
- Footer: 50px height, 16pt font
- Stimulus: Flexible (takes remaining space, typically 70% of screen)

## Chapter 7

# Structured Task Creation Architecture

### 7.1 Overview

PEBL provides a comprehensive architecture for creating structured, reusable, and maintainable psychological tests. This optional layer sits atop the core PEBL language and provides standardized systems for:

- **Layout & Response System** - Unified screen layouts with platform-aware responses (Chapter 6)
- **Parameter Management** - JSON/CSV configuration with schemas and presets
- **Translation System** - Multi-language support with structured translation files
- **Data Upload** - Centralized data collection via web servers

These systems work together to create battery tasks that are:

- **Configurable** - Parameters control all aspects without code changes
- **International** - Full translation support for any language
- **Platform-aware** - Automatic adaptation to native/web environments
- **Data-ready** - Built-in upload to servers or PEBLHub

**Important:** All of these systems are optional. Core PEBL functionality works independently, but these systems significantly reduce development time and

improve maintainability for battery tasks.

## 7.2 Parameter Management System

The parameter system allows experiments to be configured without modifying code. Parameters are defined with defaults, loaded from files or URLs, and accessed as properties throughout the experiment.

### 7.2.1 Basic Parameter Usage

Define parameters with defaults in your PEBL script:

```
define Start(p)
{
  ## Define parameters with defaults
  parpairs <- [
    ["numTrials", 20],
    ["responsemode", "keyboardShift"],
    ["showFeedback", 1],
    ["stimulusDuration", 1000]
  ]

  ## Load parameters (from file or use defaults)
  gParams <- CreateParameters(parpairs, gParamFile)

  ## Access parameters as properties
  loop(trial, Sequence(1, gParams.numTrials, 1))
  {
    ShowStimulus(gParams.stimulusDuration)

    if(gParams.showFeedback)
    {
      ShowFeedback()
    }
  }
}
```

The `CreateParameters()` function:

- Returns a property list with all parameters
- Merges file values over defaults
- Supports both JSON and CSV formats
- Uses defaults if file doesn't exist or is empty

### 7.2.2 Parameter Files

PEBL supports two parameter file formats:

#### JSON Format (Recommended)

Modern format, ideal for web integration:

**File:** `params/taskname.pbl.par.json`

```
{
  "numTrials": 30,
  "responsemode": "mousetarget",
  "showFeedback": 1,
  "stimulusDuration": 1500
}
```

#### Advantages:

- Web-friendly (easy JavaScript parsing/generation)
- Supports complex types (arrays, nested objects)
- Human-readable and editable
- Can be fetched from URLs

#### CSV Format (Legacy)

Traditional format, still fully supported:

**File:** `params/taskname.pbl.par`

```
numTrials,30
responsemode,mousetarget
showFeedback,1
stimulusDuration,1500
```

**Note:** No code changes needed to support both formats. `CreateParameters()` auto-detects the format.

### 7.2.3 Parameter Schemas

Schema files provide rich metadata about parameters for documentation and web UIs. They are entirely optional but highly recommended for battery tasks.

**File:** `params/taskname.pbl.schema.json`

```
{
  "test": "taskname",
  "version": "1.0",
  "description": "A psychological test measuring...",
  "citation": "Smith et al. (2020)",
  "parameters": [
    {
      "name": "numTrials",
      "type": "integer",
      "default": 20,
      "min": 1,
      "max": 100,
      "step": 1,
      "label": "Number of Trials",
      "description": "Total number of test trials to present"
    },
    {
      "name": "responsemode",
      "type": "string",
      "default": "keyboardShift",
      "options": ["keyboardShift", "keyboardSafe",
                  "mousetarget", "mousebutton"],
      "label": "Response Mode",
      "description": "How participants respond (keyboard/mouse)"
    },
    {
      "name": "showFeedback",
      "type": "boolean",
      "default": 1,
      "label": "Show Feedback",
      "description": "Display feedback after each trial"
    },
    {
      "name": "stimulusDuration",
      "type": "integer",
      "default": 1000,
      "min": 100,
      "max": 5000,
      "step": 100,

```

```
    "unit": "ms",
    "label": "Stimulus Duration",
    "description": "How long each stimulus is displayed"
  }
]
}
```

**Schema fields:**

- **name** - Parameter identifier (used in code)
- **type** - Data type (integer, string, boolean, number, array)
- **default** - Default value
- **label** - Human-readable name
- **description** - Detailed explanation
- **min/max/step** - Numeric constraints (optional)
- **unit** - Display unit (ms, sec, px, etc.) (optional)
- **options** - Valid choices for dropdowns (optional)

### 7.2.4 Parameter Presets

Create named presets for common configurations:

**File:** params/short-version.json

```
{
  "name": "Short Version",
  "description": "Quick testing with reduced trials",
  "parameters": {
    "numTrials": 10,
    "responseMode": "keyboardShift",
    "showFeedback": 1,
    "stimulusDuration": 800
  }
}
```

**File:** params/tablet-version.json

```
{
  "name": "Tablet Version",
  "description": "Touch-screen optimized configuration",
  "parameters": {
    "numTrials": 20,
    "responseMode": "mousetarget",
    "showFeedback": 1,
  }
}
```

```
    "stimulusDuration": 1500
  }
}
```

**Usage:**

```
## Command line:
pebl2 taskname.pbl -v jsonparam=params/tablet-version.json

## Or via launcher preset dropdown
```

### 7.2.5 Loading Parameters from URLs

For web-based studies, parameters can be fetched from remote servers:

```
pebl2 taskname.pbl --pfile https://study.example.com/api/params?token=ABC123
```

The server can:

1. Read the task's `.pbl.schema.json` to understand parameters
2. Generate custom parameter JSON based on study configuration
3. Serve it to PEBL with appropriate authentication
4. Track which parameters were used for each participant

**Example workflow:**

1. Researcher configures study on web platform
2. Platform generates URL with authentication token
3. PEBL fetches JSON parameters at runtime
4. Experiment runs with server-specified configuration

### 7.2.6 Best Practices

**Parameter Naming:**

- Use descriptive names (`stimulusDuration`, not `sd`)
- Use camelCase for multi-word names
- Group related parameters with common prefixes

**Defaults:**

- Always provide sensible defaults
- Default to the most common use case
- Document defaults in schema descriptions

### Validation:

- Validate parameters at script start
- Check ranges, types, and valid options
- Provide clear error messages for invalid values

```
## Validate parameters
if(gParams.numTrials < 1 or gParams.numTrials > 100)
{
  MessageBox("Error: numTrials must be between 1 and 100", gWin)
  QuitPEBL()
}

if(not IsMember(gParams.responseMode,
  ["keyboardShift", "keyboardSafe", "mousetarget", "mousebutton"]))
{
  MessageBox("Error: Invalid responseMode", gWin)
  QuitPEBL()
}
```

## 7.3 Translation System

The translation system enables complete internationalization of battery tasks. All participant-visible text is stored in JSON files, allowing tasks to run in any language without code changes.

### 7.3.1 Basic Translation Usage

Store translations in JSON files and load them at runtime:

**File:** translations/taskname.pbl-en.json

```
{
  "INSTRUCTIONS": "Press the key corresponding to the stimulus color.",
  "PRACTICE_BEGIN": "Practice trials will begin. Press any key.",
  "PRACTICE_COMPLETE": "Practice complete! Press any key for test.",
  "TEST_BEGIN": "Test trials will begin. Press any key.",
  "TRIAL_HEADER": "Trial",
  "CORRECT_FEEDBACK": "Correct!",
  "INCORRECT_FEEDBACK": "Incorrect.",
  "TOO_SLOW": "Too slow!",
  "DEBRIEF": "Thank you for participating!"
}
```

**Load and use in PEBL:**

```
define Start(p)
{
  ## Load translations for current language
  gStrings <- GetTranslations("taskname", gLanguage)

  ## Use throughout experiment
  MessageBox(gStrings.INSTRUCTIONS, gWin)

  gLayout.header.text <- gStrings.TRIAL_HEADER + " " + trialNum
  gLayout.footer.text <- gStrings.INSTRUCTIONS

  ## Dynamic text with substitution
  feedback <- gStrings.CORRECT_FEEDBACK
  ShowMessage(feedback)
}
```

### 7.3.2 Translation File Structure

**Naming convention:** translations/taskname.pbl-LANG.json

Where LANG is the two-letter ISO 639-1 language code:

- en - English
- es - Spanish
- fr - French
- de - German
- pt - Portuguese
- cn - Chinese
- he - Hebrew
- ru - Russian
- it - Italian
- etc.

**Key conventions:**

- Use UPPERCASE for all keys (recommended)
- Use underscores to separate words (TRIAL\_HEADER)
- Group related strings with common prefixes
- Keys are case-insensitive in PEBL (can access as `.trial_header`)

### 7.3.3 Creating Translations

**Step 1:** Create English baseline

```
translations/taskname.pbl-en.json
```

**Step 2:** Copy to new language

```
cp translations/taskname.pbl-en.json \
  translations/taskname.pbl-es.json
```

**Step 3:** Translate all values (keep keys unchanged)

**Before (English):**

```
{
  "INSTRUCTIONS": "Press the key corresponding to the color.",
  "PRACTICE_BEGIN": "Practice will begin. Press any key."
}
```

**After (Spanish):**

```
{
  "INSTRUCTIONS": "Presione la tecla correspondiente al color.",
  "PRACTICE_BEGIN": "La práctica comenzará. Presione cualquier tecla."
}
```

**Step 4:** Test with new language

```
pebl2 taskname.pbl -v language=es
```

### 7.3.4 Special Characters and Formatting

**Line breaks:** Use CR(1) function in PEBL, not \n

```
## In translation file - single line
"MULTI_LINE": "First line. Second line. Third line."
```

```
## In PEBL code - split with CR(1)
lines <- SplitString(gStrings.MULTI_LINE, ".")
text <- lines[1] + CR(1) + lines[2] + CR(1) + lines[3]
```

**Unicode characters:** JSON supports full Unicode for international languages.

Translation files can contain any UTF-8 text including:

- Hebrew, Arabic (right-to-left scripts)
- Chinese, Japanese, Korean characters
- Accented Latin characters (Spanish, French, etc.)
- Special symbols and emoji

**Dynamic substitution:** Use placeholders and string replacement

```
## Translation file
"TRIAL_PROGRESS": "Trial <NUM> of <TOTAL>"

## PEBL code
text <- SubstituteStrings(gStrings.TRIAL_PROGRESS,
                        [["<NUM>", trial + ""],
                        [ "<TOTAL>", gParams.numTrials + "" ]])
## Result: "Trial 5 of 20"
```

### 7.3.5 Fallback Strategy

The translation system uses a sophisticated three-tier fallback mechanism to ensure translations are always available:

#### Three-Tier Fallback

**Tier 1: Explicit Language** (if gLanguage is non-empty)

```
## Try language specified via --language or -v language=XX
pebl2 taskname.pbl --language es
## Looks for: translations/taskname.pbl-es.json
```

**Tier 2: System Locale** (if gLanguage is empty or Tier 1 failed)

The system automatically detects the operating system locale using `GetSystemLocale()`:

```
## On a Spanish-language system (locale: es_ES)
pebl2 taskname.pbl
## Automatically looks for: translations/taskname.pbl-es.json
```

```
## On a Chinese system (locale: zh_CN)
pebl2 taskname.pbl
## Automatically looks for: translations/taskname.pbl-zh.json
```

The system extracts the two-letter language code from the full locale string (e.g., “es\_ES” becomes “es”, “zh\_CN” becomes “zh”).

**Tier 3: English Fallback** (if both tiers fail)

```
## If neither explicit language nor system locale translation exists
## Falls back to: translations/taskname.pbl-en.json
```

### Fallback Examples

#### Example 1: Explicit language overrides system

```
## System locale: de_DE (German)
## Command: pebl2 taskname.pbl --language fr
## Result: Uses French translation (tier 1 explicit override)
```

#### Example 2: System locale detection

```
## System locale: ja_JP (Japanese)
## Command: pebl2 taskname.pbl
## gLanguage is empty, so system locale is detected
## Result: Uses Japanese translation (tier 2 system locale)
```

#### Example 3: English fallback

```
## System locale: ko_KR (Korean)
## Command: pebl2 taskname.pbl
## But translations/taskname.pbl-ko.json doesn't exist
## Result: Falls back to English (tier 3)
```

#### Example 4: Custom language identifiers

The `-language` parameter accepts any string, not just ISO 639-1 codes. This enables custom language variants:

```
pebl2 taskname.pbl --language es-mx
## Looks for: translations/taskname.pbl-es-mx.json
## (Mexican Spanish variant)
```

```
pebl2 taskname.pbl --language en-uk
## Looks for: translations/taskname.pbl-en-uk.json
## (British English variant)
```

### Checking Translation Availability

Always check if strings are available for error handling:

```
gStrings <- GetTranslations("taskname", gLanguage)

if(Length(GetPropertyList(gStrings)) == 0)
{
  MessageBox("Warning: No translation file found. Using defaults.", gWin)
  ## Provide hardcoded fallback strings
}
```

However, with the three-tier fallback system, this should only occur if no translation files exist at all (including English).

### 7.3.6 Translation Best Practices

**What to translate:**

- All instructions and debriefing text
- Header and footer text
- Feedback messages
- Response labels ("LEFT", "RIGHT", etc.)
- Error messages
- Any participant-visible text

**What NOT to translate:**

- Stimulus content (if language-specific by design)
- Data file headers and output
- Internal debug messages
- Parameter names

**Testing translations:**

- Test with at least two languages
- Verify text fits in layout zones
- Check right-to-left languages (Hebrew, Arabic)
- Ensure special characters display correctly
- Have native speakers review translations

**Organizing large translation sets:** For tasks with many strings, group by function:

```
{
  "INST_1": "First instruction...",
  "INST_2": "Second instruction...",
  "PRACTICE_HEADER": "Practice",
  "PRACTICE_BEGIN": "Practice will begin...",
  "PRACTICE_COMPLETE": "Practice complete...",
  "TEST_HEADER": "Test",
  "TEST_BEGIN": "Test will begin...",
  "FEEDBACK_CORRECT": "Correct!",
  "FEEDBACK_INCORRECT": "Incorrect.",
  "DEBRIEF_THANKS": "Thank you..."
}
```

## 7.4 Data Upload System

The data upload system enables centralized collection of experimental data to web servers. PEBL supports uploading to two server types:

- **PEBL Simple Data Server** - Included with PEBL (`dataserver/`)
- **PEBLHub Online** - Cloud platform at `peblhub.online`

### 7.4.1 Upload Configuration

Create an `upload.json` file specifying server details:

**File:** `upload.json`

```
{
  "server": "your-domain.com",
  "page": "/pebl-data/upload.php",
  "port": "80",
  "username": "admin",
  "upload_password": "yourpassword",
  "taskname": "stroop"
}
```

**For HTTPS (recommended):**

```
{
  "server": "your-domain.com",
  "page": "/pebl-data/upload.php",
  "port": "443",
  "username": "admin",
  "upload_password": "yourpassword",
  "taskname": "stroop"
}
```

**File location:** Place `upload.json` in the same directory as your `.pbl` script.

### 7.4.2 Using Upload in PEBL Scripts

#### Basic Upload

Upload data files after experiment completes:

```
define Start(p)
{
  ## ... run experiment ...
}
```

```
## Close data file
FileClose(gFileOut)

## Upload to server
if(FileExists("upload.json"))
{
  success <- UploadFile(gSubNum, gFileOut)

  if(success)
  {
    MessageBox("Data uploaded successfully!", gWin)
  } else {
    MessageBox("Upload failed. Data saved locally.", gWin)
  }
}
}
```

### Parameter-Controlled Upload

Allow upload to be enabled/disabled via parameters:

```
define Start(p)
{
  ## Define parameters
  parpairs <- [
    ["uploadData", 0],
    ["uploadURL", ""],
    ["numTrials", 20]
  ]

  gParams <- CreateParameters(parpairs, gParamFile)

  ## ... run experiment ...

  FileClose(gFileOut)

  ## Upload if enabled
  if(gParams.uploadData)
  {
    ## Show upload screen
    MessageBox("Uploading data, please wait...", gWin)

    ## Upload
    success <- UploadFile(gSubNum, gFileOut)
  }
}
```

```
## Report result
if(success)
{
    MessageBox("Upload complete!", gWin)
} else {
    MessageBox("Upload failed. Data saved locally at: " +
               gFileOut, gWin)
}
}
```

**Schema entry for upload parameters:**

```
{
    "name": "uploadData",
    "type": "boolean",
    "default": 0,
    "label": "Upload Data",
    "description": "Upload results to server after completion"
},
{
    "name": "uploadURL",
    "type": "string",
    "default": "",
    "label": "Upload Server URL",
    "description": "Server URL for data upload (if enabled)"
}
```

### 7.4.3 PEBL Simple Data Server

The Simple Data Server is a lightweight PHP server included in `pebl/dataserver/`. It requires no database and runs on any PHP 5.5+ web server.

#### Server Features

- Single admin account (username/password)
- Automatic subject number generation
- Organized file structure: `uploads/taskname/subnum/`
- File validation and security
- Works on shared hosting (cPanel, etc.)
- No database required

## Quick Server Setup

**Step 1:** Upload files to web server

```
your-domain.com/pebl-data/  
  config.php  
  upload.php  
  getnewsubnum.php  
  generate_password.php  
  .htaccess  
  counter.txt (auto-created)  
  uploads/ (auto-created)
```

**Step 2:** Set permissions

```
chmod 755 uploads/  
chmod 644 config.php upload.php getnewsubnum.php
```

**Step 3:** Change default password

Generate password hash:

```
php generate_password.php yourNewPassword
```

Edit config.php:

```
define('ADMIN_PASSWORD_HASH', 'your-hash-here');
```

**Step 4:** Test upload

```
curl -X POST \  
  -F "user_name=admin" \  
  -F "upload_password=yourpassword" \  
  -F "taskname=test" \  
  -F "subnum=001" \  
  -F "fileToUpload=@test.csv" \  
  http://your-domain.com/pebl-data/upload.php
```

## Getting Subject Numbers

The server can generate sequential subject numbers:

**PEBL function:**

```
gSubNum <- GetNewSubNum("your-domain.com",  
                        "/pebl-data/getnewsubnum.php",  
                        "80",  
                        "admin",  
                        "yourpassword")
```

```
Print("Assigned subject number: " + gSubNum)
```

This ensures unique subject numbers across multiple testing stations.

### Server File Structure

Data is organized hierarchically:

```
uploads/
  stroop/
    001/
      stroop.csv
      stroop_1.csv
    002/
    003/
  ant/
    001/
    002/
```

# Task name  
# Subject number  
# Auto-numbered if duplicate  
# Another task

### Server Configuration

Edit config.php to customize:

```
// Admin credentials
define('ADMIN_USERNAME', 'admin');
define('ADMIN_PASSWORD_HASH', 'your-hash');

// Upload limits
define('MAX_FILE_SIZE', 10485760); // 10MB
define('ALLOWED_EXTENSIONS', ['txt', 'csv', 'tsv', 'dat', 'log']);

// Timezone
date_default_timezone_set('America/New_York');

// Debug mode (for troubleshooting)
define('DEBUG_MODE', false);
```

### Security Best Practices

- **Use HTTPS** - Always use SSL/TLS encryption (port 443)
- **Strong passwords** - Use 12+ character passwords
- **Regular backups** - Download uploads/ directory regularly
- **Monitor uploads** - Check for unusual files periodically
- **IP restrictions** - Limit access to known networks (optional)

- **Update PHP** - Use PHP 7.4+ for security patches

#### 7.4.4 PEBLHub Online

PEBLHub (peblhub.online) is a cloud-based platform for PEBL data collection. It provides:

- Web-based experiment launching
- Centralized data management
- Study creation and configuration
- Participant tracking
- Data visualization and export
- No server setup required

#### Using PEBLHub

**Step 1:** Create account at peblhub.online

**Step 2:** Create a study and configure tests

**Step 3:** Download test package from PEBLHub

PEBLHub allows you to download a complete test package that includes the test script, parameters, translations, and a pre-configured `upload.json` file. Simply download the package from your study dashboard and run it locally—upload settings work out-of-the-box without any additional configuration.

**Step 4:** (Alternative) Manually create `upload.json` with PEBLHub credentials

If you prefer to configure upload manually, get credentials from study settings and create:

```
{
  "server": "peblhub.online",
  "page": "/api/upload",
  "port": "443",
  "username": "your-study-id",
  "upload_password": "your-study-token",
  "taskname": "stroop"
}
```

**Step 5:** Upload is automatic when experiment completes

### PEBLHub Features

- **Study Management** - Create and configure multi-test batteries
- **Participant Portal** - Secure links for participant access
- **Data Dashboard** - Real-time collection monitoring
- **Bulk Export** - Download all data as CSV/JSON
- **Test Library** - Browse and deploy battery tests
- **Version Control** - Track parameter changes over time

#### 7.4.5 Upload Best Practices

##### Error Handling:

```
## Always handle upload failures gracefully
success <- UploadFile(gSubNum, gFileOut)

if(not success)
{
  ## Inform participant
  MessageBox("Data saved locally. Please contact experimenter.", gWin)

  ## Log failure
  Print("WARNING: Upload failed for subject " + gSubNum)

  ## Data is still saved locally - never lost!
}
```

##### Network Testing:

- Test uploads on actual network before study
- Check firewall and proxy settings
- Verify HTTPS certificates are valid
- Test with slow/unreliable connections

##### Participant Privacy:

- Use subject numbers, not names
- Avoid collecting identifying information in data files
- Ensure server has appropriate security
- Follow institutional IRB requirements

##### Backup Strategy:

- Local data files are always saved (even if upload fails)
- Download server data regularly
- Keep local backups during data collection
- Verify data integrity after upload

## 7.5 Complete Example Task

This example demonstrates all systems working together:

### 7.5.1 Directory Structure

```
battery/mytask/
  mytask.pbl                # Main script
  mytask.pbl.about.txt      # Task description
  params/
    mytask.pbl.schema.json  # Parameter schema
    mytask.pbl.par.json     # Default parameters
    short-version.json      # Preset: short version
    tablet-version.json     # Preset: tablet mode
  translations/
    mytask.pbl-en.json      # English strings
    mytask.pbl-es.json      # Spanish strings
    mytask.pbl-fr.json      # French strings
  upload.json               # Upload configuration
  data/                     # Output (auto-created)
```

### 7.5.2 Parameter Schema

File: params/mytask.pbl.schema.json

```
{
  "test": "mytask",
  "version": "1.0",
  "description": "Example task demonstrating full architecture",
  "parameters": [
    {
      "name": "numPracticeTrials",
      "type": "integer",
      "default": 5,
      "min": 0,
      "max": 20,
      "label": "Practice Trials",
```

```
    "description": "Number of practice trials"
  },
  {
    "name": "numTestTrials",
    "type": "integer",
    "default": 20,
    "min": 1,
    "max": 100,
    "label": "Test Trials",
    "description": "Number of test trials"
  },
  {
    "name": "responsemode",
    "type": "string",
    "default": "auto",
    "options": ["auto", "keyboardShift", "keyboardSafe",
               "mousetarget", "mousebutton"],
    "label": "Response Mode",
    "description": "Response method (auto = platform-aware)"
  },
  {
    "name": "showFeedback",
    "type": "boolean",
    "default": 1,
    "label": "Show Feedback",
    "description": "Display feedback after each trial"
  },
  {
    "name": "uploadData",
    "type": "boolean",
    "default": 0,
    "label": "Upload Data",
    "description": "Upload data to server after completion"
  }
]
}
```

### 7.5.3 Translation Files

File: translations/mytask.pbl-en.json

```
{
  "TITLE": "My Task",
  "INSTRUCTIONS": "Press the key corresponding to the stimulus.",
  "PRACTICE_BEGIN": "Practice will begin. Press any key.",
  "PRACTICE_COMPLETE": "Practice complete! Press any key for test.",
  "TEST_BEGIN": "Test will begin. Press any key.",
  "TRIAL_HEADER": "Trial",
  "FEEDBACK_CORRECT": "Correct!",
  "FEEDBACK_INCORRECT": "Incorrect.",
  "FOOTER_PROMPT": "Respond as quickly and accurately as possible.",
  "UPLOADING": "Uploading data...",
  "UPLOAD_SUCCESS": "Upload complete!",
  "UPLOAD_FAILED": "Upload failed. Data saved locally.",
  "DEBRIEF": "Thank you for participating!"
}
```

File: translations/mytask.pbl-es.json

```
{
  "TITLE": "Mi Tarea",
  "INSTRUCTIONS": "Presione la tecla correspondiente al estímulo.",
  "PRACTICE_BEGIN": "La práctica comenzará. Presione cualquier tecla.",
  "PRACTICE_COMPLETE": "¡Práctica completa! Presione para la prueba.",
  "TEST_BEGIN": "La prueba comenzará. Presione cualquier tecla.",
  "TRIAL_HEADER": "Ensayo",
  "FEEDBACK_CORRECT": "¡Correcto!",
  "FEEDBACK_INCORRECT": "Incorrecto.",
  "FOOTER_PROMPT": "Responda lo más rápido y preciso posible.",
  "UPLOADING": "Subiendo datos...",
  "UPLOAD_SUCCESS": "¡Carga completa!",
  "UPLOAD_FAILED": "Fallo de carga. Datos guardados localmente.",
  "DEBRIEF": "¡Gracias por participar!"
}
```

### 7.5.4 Main Script

File: mytask.pbl

```
define Start(p)
{
  ##=====
  ## SETUP
  ##=====
}
```

```
gScriptname <- "My Task"

## Define parameters with defaults
parpairs <- [
  ["numPracticeTrials", 5],
  ["numTestTrials", 20],
  ["responsemode", "auto"],
  ["showFeedback", 1],
  ["uploadData", 0]
]

## Load parameters (from file, URL, or defaults)
gParams <- CreateParameters(parpairs, gParamFile)

## Create window
gWin <- MakeWindow("black")

## Get subject number
if(gSubNum+" " == "0")
{
  gSubNum <- GetSubNum(gWin)
}

## Load translations
gStrings <- GetTranslations("mytask", gLanguage)

##=====
## CREATE LAYOUT & RESPONSE SYSTEM
##=====
gLayout <- CreateLayout("mytask", gWin, gParams)

## Configure zones
gLayout.header.text <- gStrings.TITLE
gLayout.footer.text <- gStrings.INSTRUCTIONS

##=====
## DATA FILE
##=====
gFileOut <- GetNewDataFile(gSubNum, gWin, "mytask", "csv",
  "subnum,trial,phase,stimulus,response,correct,rt,timestamp")

##=====
## INSTRUCTIONS
##=====
MessageBox(gStrings.INSTRUCTIONS, gWin)
```

```
##=====
## PRACTICE TRIALS
##=====
if(gParams.numPracticeTrials > 0)
{
  gLayout.subheader.text <- "PRACTICE"
  gLayout.footer.text <- gStrings.PRACTICE_BEGIN
  Draw()
  WaitForAnyKeyPress()

  loop(trial, Sequence(1, gParams.numPracticeTrials, 1))
  {
    result <- RunTrial("practice", trial)
    FilePrint(gFileOut, result)
  }

  ## Practice complete
  gLayout.footer.text <- gStrings.PRACTICE_COMPLETE
  Draw()
  WaitForAnyKeyPress()
}

##=====
## TEST TRIALS
##=====
gLayout.subheader.text <- "TEST"
gLayout.footer.text <- gStrings.TEST_BEGIN
Draw()
WaitForAnyKeyPress()

loop(trial, Sequence(1, gParams.numTestTrials, 1))
{
  result <- RunTrial("test", trial)
  FilePrint(gFileOut, result)
}

##=====
## DATA UPLOAD
##=====
FileClose(gFileOut)

if(gParams.uploadData)
{
  ## Show upload screen
  gLayout.header.text <- gStrings.UPLOADING
  gLayout.footer.text <- ""
}
```

```
    Draw()

    ## Upload
    success <- UploadFile(gSubNum, gFileOut)

    ## Report result
    if(success)
    {
        gLayout.footer.text <- gStrings.UPLOAD_SUCCESS
    } else {
        gLayout.footer.text <- gStrings.UPLOAD_FAILED
    }

    Draw()
    Wait(2000)
}

##=====
## DEBRIEF
##=====
gLayout.header.text <- gStrings.TITLE
gLayout.subheader.visible <- 0
gLayout.footer.text <- gStrings.DEBRIEF
Draw()
WaitForAnyKeyPress()
}

define RunTrial(phase, trialNum)
{
    ## Update header
    gLayout.header.text <- gStrings.TITLE + " - " +
        gStrings.TRIAL_HEADER + " " + trialNum

    ## Generate stimulus (example: random color)
    colors <- ["red", "blue", "green", "yellow"]
    stimulus <- SampleN(colors, 1)[1]
    correctResp <- First(["left", "right"])

    ## Show stimulus
    stim <- Circle(gLayout.stimulusRegion.centerX,
        gLayout.stimulusRegion.centerY,
        50, MakeColor(stimulus), 1)
    AddObject(stim, gWin)
    Draw()

    ## Collect response
```

```
startTime <- GetTime()
response <- WaitForLayoutResponse(gLayout, 5000)
rt <- GetTime() - startTime

## Determine correctness
correct <- (response == correctResp)

## Show feedback (if enabled)
if(gParams.showFeedback)
{
  if(response == "<timeout>")
  {
    feedback <- "TOO SLOW"
  } else {
    if(correct)
    {
      feedback <- gStrings.FEEDBACK_CORRECT
    } else {
      feedback <- gStrings.FEEDBACK_INCORRECT
    }
  }
}

ShowFeedback(feedback, 500)
}

## Clean up
RemoveObject(stim, gWin)

## Return data row
return(gSubNum + "," + trialNum + "," + phase + "," +
      stimulus + "," + response + "," + correct + "," +
      rt + "," + TimeStamp())
}

define ShowFeedback(message, duration)
{
  ## Show feedback in subheader
  gLayout.subheader.text <- message
  gLayout.subheader.visible <- 1
  Draw()
  Wait(duration)
  gLayout.subheader.visible <- 0
  Draw()
}
```

### 7.5.5 Running the Task

**Default configuration:**

```
pebl2 battery/mytask/mytask.pbl
```

**With Spanish translation:**

```
pebl2 battery/mytask/mytask.pbl --language es
```

**With preset configuration:**

```
pebl2 battery/mytask/mytask.pbl --pfile params/tablet-version.json
```

**With specific subject number:**

```
pebl2 battery/mytask/mytask.pbl -s 042
```

**With remote parameters:**

```
pebl2 battery/mytask/mytask.pbl \  
  --pfile https://study.com/api/params?token=ABC123
```

## 7.6 Migration Checklist

To add structured architecture to existing battery tasks:

### 7.6.1 Parameters

- Create `params/taskname.pbl.schema.json` with all parameters
- Create `params/taskname.pbl.par.json` with defaults
- Replace hardcoded values with `gParams.paramname`
- Add parameter validation at script start
- Create preset files for common configurations
- Test with various parameter combinations

### 7.6.2 Translations

- Create `translations/` directory
- Extract all participant-visible text to `-en.json`
- Replace hardcoded strings with `gStrings.KEY`
- Load translations with `GetTranslations()`
- Test with English to verify extraction

- Create additional language translations
- Test with multiple languages

### 7.6.3 Layout & Response System

- Add `responsemode` parameter
- Replace hardcoded layouts with `CreateLayout()`
- Use `WaitForLayoutResponse()` for input
- Update instructions based on response mode
- Test with each response mode
- Test on native and Emscripten platforms

### 7.6.4 Data Upload

- Add `uploadData` parameter
- Add upload logic after file close
- Handle upload failures gracefully
- Create `upload.json` example file
- Test upload with local server
- Document upload setup in `.about.txt`

## 7.7 Summary

The structured task creation architecture provides:

- **Configurability** - Parameters control all aspects without code changes
- **Internationalization** - Full translation support for any language
- **Platform awareness** - Automatic adaptation to native/web environments
- **Data collection** - Built-in upload to self-hosted or cloud servers
- **Maintainability** - Standardized structure across all battery tasks
- **Documentation** - Self-describing schemas and translation files

## ***Chapter 7.*** Structured Task Creation Architecture

---

All systems are optional and can be adopted incrementally. Core PEBL functionality remains independent, ensuring backward compatibility with existing experiments.

For detailed information on the Layout & Response System, see Chapter 6.

## Chapter 8

# The PEBL Launcher

The PEBL Launcher is the best way to navigate and launch PEBL experiments, especially for novices or research assistants. It allows one to specify a few specific options that are frequently changed, navigate through the PEBL Test Battery, and create and save 'experiment chains' to let you run multiple experiments in a row.

**Figure 1:** Screenshot of of PEBL Launcher.

## 8.1 History of the Launcher

Prior to 2011, a front-end launcher was only available for PEBL on Windows. It was written in Visual Basic 6, which was old-fashioned, single-platform, no longer supported by Microsoft, and created a situation where a critical piece of PEBL infrastructure depended on a non-free tool. The main obstacle to a new launcher has always been: PEBL needs a cross-platform launcher using a free software, and we don't want to have to distribute a whole additional interpreter. This means that Python, wxBasic, TCL/TK, etc. were out of the consideration. Why couldn't there be an easy-to-use cross-platform programming tool we could use?

As of PEBL Version 0.12, we found one: PEBL itself. PEBL is not really designed to create GUI applications, but it can be beat into submission to do so. For Version 0.12, enough filesystem access functions and other features were available to make a reasonable launcher.

For PEBL 0.14, the launcher received a major overhaul. With the advent of custom objects, we added a bunch of GUI objects (buttons, scrolling text boxes, checkboxes, menus, etc.) that enabled a much more polished version of the launcher that integrates better with other desktop options. This allowed streamlining the launcher, adding functionality, improving its usefulness in the research lab. This includes the ability to set and change script-based parameters, which allows an experimenter to better tailor the PEBL battery tests to their particular needs.

## 8.2 How it works

The simplest usage of the Launcher is that you use the file selector on the left to choose a .pbl file, then click the button 'Run selected script' to run that experiment. ONLY .pbl files and directories will appear in the file window.

## 8.3 Features

### 8.3.1 File browser

On the left is a file browser. It will only show .pbl files and subdirectories. To navigate to a subdirectory, simply click on the directory to select it, then click on the selected directory. To move back up a directory, click on the '..\.' row. When you have a .pbl file selected, you can use the 'Run selected script' button to launch it.

Figure 2: The File Browser.

### 8.3.2 Participant code

This will allow you to select the participant code you want sent to any experiments you are about to run. By default, PEBL saves the last experiment code when you exit, and then reloads it the next time, incrementing by one. This makes it easier to avoid colliding participant codes and overwriting data. Participant code need not be a number, but the launcher currently does not understand how to increment non-numeric codes, and will probably restart at

1. The plus button next to the code box will increment the current number by 1, which is useful if you are running multiple sessions in a row.

The automatic incrementation of participant code can be turned off by opening the fileselect.pbl file and changing the variable gAutoSubcode from 1 to 0.

When an experiment is launched, the specified code will be fed into the experiment using the -s command-line option, and will be bound to the gSubNum variable. Some of the standard experiments will ask you to enter a participant code regardless of whether you have one selected. If that is the case, you should be able to edit the script to remove the request to specify a participant code. However, most experiments in the test battery should only ask the experimenter to specify a participant code if the participant code is '0', which is what it will be when no -s command is given. So, if you are using code 0, many of the experiments will ask you to enter a code after they launch.

### 8.3.3 Experimenter code

Many times, you may wish to keep track of the experimenter or research assistant who collected the data. Have them enter their name in the 'experimenter' window. The name will be saved on exit. The experimenter code will be saved to the runlog file (see below).

### 8.3.4 Language

Some experiments have instructions and stimuli that are translated into different languages. Enter your two-character language code in the language box to tell the experiment what language to use. If your chosen language is not available, the experiment will fall back to English. For Chinese and related languages, setting this will also change the default fontface used. If you want to translate an experiment into your own language, ask on the PEBL mailing list.

### 8.3.5 Command Line Options

There are a number of command line options available for PEBL that are not present as options in the launcher. If you want to use any, you can type them in the "Command line Options" box and the launcher will pass them to PEBL. You can use these to specify -V options that pass parameters into your experiment (e.g., controlling whether a practice or a test round is given).

### 8.3.6 Edit and Parameters

The Edit button will let you edit the parameters used in the test. When you edit and save the parameter set, it will then appear as an option in the parameters pulldown. Before you run an experiment, you can select the parameter set you want to use from the pulldown (or save it permanently to an experiment chain).

### 8.3.7 Fullscreen Mode

If you want to launch your experiment in full-screen mode to improve video latency and to avoid distractions, check this box. The secret escape key combo `ctrl-alt-shift-\\`: hit these four to abort out of an experiment before it is complete.

### 8.3.8 Demographics Collection

The U.S. NIMH requires a number of demographic variables for research they fund. Checking this box will collect this data and save it to a data log file called `demographics-log.csv`, prior to running your experiment or experiment chain.

### 8.3.9 Experiment Chains

The launcher allows you to set up a 'chain' of experiments that get run in sequence. All the experiments will be run consecutively, with an identical subject code. This is accomplished by running a separate instance of PEBL for each experiment. This can sometimes lead to a 'flash' between each experiment if running in fullscreen mode. Below the experiment chain window is a pulldown that lets you select the particular chain you want to use. The default chain is loaded by default, and is also responsible for setting the parameter sets above.

### 8.3.10 Saving Experiment Chains

When you exit the launcher, the current experiment chain will get saved in the the current config file. By default, this file is called `default.config`. This same file is loaded when the launcher starts again, restoring your settings. By hitting the 'save chain' button, you will be asked to enter a new name to save the current configuration under. Similarly, 'Delete chain' will delete the file in which the current chain is saved. A chain can be loaded at start-up (by specifying the name of the config file with the `-v` command-line option).

### 8.3.11 Editing Experiment chains

A chain can be edited by inserting, appending, or deleting steps, or clearing the entire chain, using the buttons below the experiment chain box. Be sure to save the chain after editing so your edits will be saved.

### 8.3.12 Loading Experiment Chains

A previously saved experiment chain can be loaded by selecting the chain name from the pulldown selection box.

### 8.3.13 Description and Screenshot

On the right side of the launcher is a window that will show a screenshot and print a description of a script when it is highlighted. These need to be created by hand for each script. The launcher does its best to show you a preview of the test inside any directory. But to run an experiment, you need to select a .pbl file in the file window on the left. So, even if a screenshot appears on the right, you need to select the actual .pbl file to run the experiment.

### 8.3.14 Message feedback windows

Whenever a PEBL script runs, error and debug messages are saved to files called stdout.txt and stderr.txt, within the directory the file is run from. When a test is completed, PEBL will look for and try to load these files in the tabbed window at the bottom of the launcher. stdout.txt typically contains any messages saved using the Print() command, and is useful for debugging code. If an experiment crashes, it will be logged in the stderr.txt file and the Error messages tab. In addition, a lot of bookkeeping information is saved to that file, which can help diagnose other possible problems. If you need to access these files directly to help report bugs, you can open them using the 'Open Debug Output' and 'Open error output' buttons.

### 8.3.15 Other buttons

The launcher has a number of other buttons to help you use PEBL. These include:

- *Open/Edit selected* On the lower left, there is a button labeled “Open/Edit selected”. This will open a selected .pbl script in a text editor, and will open a directory in your system’s file manager. An easy way to look at or make changes to the script, or to locate data files after a script is run.
- *Wiki* This will launch a web browser that will take you to the PEBL wiki page that is related to the currently selected test. This should help provide information about the test, its background, parameters, and data format.
- *Combine data* This will launch a data combining utility described below. It will help merge all your data files together into a single spreadsheet.
- *Open debug output* Whenever an experiment is run, any time you use the Print() function, it will print the resulting text to a file named stdout.txt in the directory it was run in. This button will open that file.
- *Open error output* Whenever an experiment is run, the error and status messages are saved to a file called stderr.txt in the directory it was run in. This button will open that file.

### 8.3.16 Menu

A lot of functionality is present in menus at the top of the window.

- *File/Exit* This will exit the launcher and save the current configuration options to the named experiment chain.
- *Options/change launcher size.* The launcher has trouble running on netbooks with only 600 pixels vertical distance. This will make a ‘small’ launcher that is more compact, but only works next time the launcher is opened.
- *Help/About* This provides a short description of the launcher.
- *Help/Manual* This opens the PEBL .pdf manual. The manual is located in different places on each platform, and will change names for each release.
- *Help/Website* This will take you to the main PEBL website.
- *Help/Wiki* This button will take you to the PEBL wiki, and do its best to find a WIKI page related to the experiment you are looking at. They won’t always exist, and if not, you can always sign in and make your own.
- *Help/Tutorial* This will open a wiki page containing a basic PEBL usage tutorial.

- *Help/Review* This will let you provide feedback about PEBL
- *Help/Donate* This will let you donate funds to help support PEBL development.

## 8.4 Launching an experiment

To launch an experiment, navigate through the directories in the file listing box. Only directories and files with the .pbl extension are shown in this box. To open a directory, click once to move the highlight box onto the directory name, and a second time to open the directory. When a new directory is opened, the first available .pbl file will be automatically selected. To run that script, just press the 'Run Selected script' button above the file select box. It will run with the specified parameter, including subject code, language, fullscreen mode. In addition, if the 'collect demographics' button is selected, a demographic survey will happen prior to the study running.

## 8.5 Launching an experiment chain

If you have a series of experiments you want to run, create an experiment chain and launch it using the 'Launch chain' button above the experiment chain selection box. Tip: Use experiment chains even if you are running just single experiment, with just a single experiment selected. This give faster access and is less error-proned.

## 8.6 Translating the Launcher

You can translate the launcher to your own language. Open the launcher file (fileselect.pbl), and go to the end of the script, to a function named "GetStrings":

```
define GetStrings(lang)
{
  lang <- Uppercase(lang)
  if(lang == "EN")
  {
    gRunText <- "Run selected script"
    gOpenText <- "Open"
    gExitText <- "EXIT"
    gViewDebugText <- "View debug output"
    gViewErrorText <- "View error output"
    gAddToChainText <- "Add to Chain"
```

```
gClearChainText <- "Clear Chain"
gSaveChainText <- "Save Chain"
....
```

The labels used in the launcher all appear here. You should be able to just translate the text of each on into the language of your choice. Send the translations back to the author so they can be incorporated into the next launcher version. You can also make a section in the if statement for your particular language. When you change the language in launcher, it will save that option and use your language of choice next time.

### 8.7 Utility:Parameter setting

Version 0.14 of the PEBL Launcher allows you to set parameters from tests before launching. A basic screenshot is shown below:

Parameter	Value	Description
iti	4000	Inter-trial interval, in ms. (default: [4000])
showfooter	1	Show/hide footer ("left-shift" and "right-shift")--(showFooter 0 == hide / showFooter 1 == show) (default: [1])
leftresponse	<lshift>	Left response key. An alternative value is z. (default: [<lshift>])
rightresponse	<rshift>	Right response key. An alternative is j. (default: [<rshift>])
reps	2	Number of repetitions through the design (which is 4 cue conditions x 2 target locations x 2 target directions x 3 flanker conditions (default: [2])
showRT	0	Show/hide reaction time display in practice block (ShowRT <- 0 == hide / gShowRT <- 1 == show) (default: [0])
showNeutralFlankers	0	Show/hide neutral flankers (dashes in the neutral condition) (gShowNeutralFlankers <- 0 == hide / gShowNeutralFlankers <- 1 == show) (default: [0])

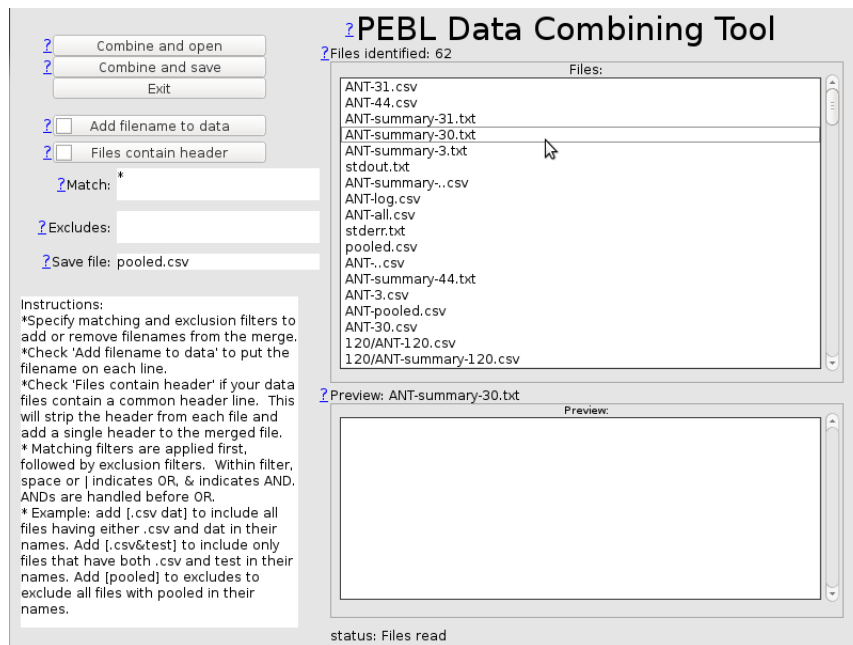

Here, the first column shows the name of the parameter. The second is the current value, which can be edited by clicking on the box and typing a new value. When complete, hit enter and the new set will be recorded. The rightmost column provides a basic description of the parameter, and its default value.

To create a new parameter set, write the name of the parameter set you want to use in the box at the top of the screen. Then, when you hit 'Save file and exit', it will be saved to this parameter file. There is no need to include .par in the filename, as it will be added if you do not add it yourself. To edit a current parameter set, select the parameter set you want and press 'edit' in the main window.

## 8.8 Utility: Combining data files

Once an experiment is done, the data files are typically stored within the data directory in which the test appeared. Furthermore, each participant may be saved in his or her own subdirectory. On some tests, a merged or pooled data file is also saved, but this is not always the case. In order to merge all of your data into one master file, you can use PEBL's data combining tool, accessible through a button on the lower left of the launcher.

To use this, navigate to the data directory of your tests, and click the 'Combine data' button. A screen like the one below should open.

On the upper right, a list of all files within the selected directory (and subdirectories) will be displayed. You want to choose some (but probably not all) of these. You can choose a subset by typing match values into the match and exclude boxes on the left. Currently, the \* indicates all files will match. You may want to just include .csv files, in which case deleting the \* and typing csv into the box will bring up only files with csv in their name. You may want to exclude summary files, in which case you can type summary into the excludes box. Each time you change the selection criteria and hit enter, the list of files will update. A preview of any of the files can be seen in the lower right window. IN the match and exclude boxes, spaces act as logical 'or's. matching with the following '\* csv' will match all files, because the first \* will match all files. Or can also be specified using the | character. The & character can be used to specify AND criteria. To match csv files from participant 300, you would enter

'300&csv'. The matches are process before the excludes.

Once you have selected the right files using match and exclude criteria, you should determine whether the files have a header. If they have a header, you probably want to remove the header, including just once in the merged file. The combiner is not smart enough to detect this on its own, so you must check 'files contain header' if you want the header stripped from each individual data set and added to the final merged set.

Finally, especially if your data does not have a participant code in it, you may check 'add filename to data' which will add a column at the beginning of the data indicating the source file of each row of data.

Once you are ready, you can choose 'combine and save' which will save the data to the filename you specified in 'save file'. If you use the combiner more than once, be sure to exclude 'pooled' from your match list so you don't get multiple copies of your data. You can also choose 'combine and open', which will create the pooled file, but then try to open in with whatever program is associated with that file type (i.e., microsoft excel for .csv files).

## Chapter 9

# PEBL User Interface Functions

As PEBL matured, there was a need to create a number of cross-platform tools, including the launcher, the data combiner, a customized launcher, and the like. Because PEBL is already a cross-platform toolkit, we decided to implement a set of UI primitives to make this possible, within PEBL itself. These functions are primarily defined in `pebl-lib`

`UI.pbl`. An example application using most of these graphical primitives is provided in `demo`  
`ui-demo.pbl`.

This chapter is a basic overview and tutorial for these functions. Many of these functions are sort of secondary to the main functions related to experiment design, and so in some cases they are not documented in the main reference section.

### 9.1 Overview

The UI objects described here share a number of things in common. They are 'custom' objects with methods defined within the object, so that the `Draw`, `Move`, `Add`, `Remove`, `Clickon`, and `inside`, functions will work directly on them, overriding the base function names.

Thus, if you create an object, although it really is a data structure usually containing various pieces of information and graphical output, you can use common functions to interact with it:

```
button <- MakeButton("Buttonname",100,100,gWin,150)
AddObject(button,gWin)
```

```
Move(button,300,300)
```

Each object has an associated function called with the 'ClickOn' method that handles a click on the object. It takes two arguments; the object itself, and the xy mouseclick event. Thus, you can create a bunch of UI elements of different types, then use a single loop to handle any event there. For example, if items holds a list of graphical elements defined earlier:

```
cont <- 1
items <- [done,sb,check,pulldown,pulldown2,
         testmessage,testentry,textscroll,
         menu1,menu2,menu3,menu4]

while(cont)
{

  resp <- WaitForClickOnTarget(items,
                              Sequence(1,Length(items),1))
  obj <- Nth(items,resp)
  CallFunction(obj.clickon,[obj,gClick])
  Draw()

  #Exit condition:
  cont <- (resp>1)
}
```

Here, gClick holds the keypress event at the end of WaitForClickOntarget.

## 9.2 TextEntry

A textentry is a single-row text box that allows the user to enter text when they click on it. It has a label that is above the text entry box (with unimplemented layout parameter that in the future will let you change the layout). and its property .value will contain the text entered. When one clicks on it, it will do a standard text entry. One must hit enter to input the value, and nothing else can happen until enter is clicked. If you want to set the value, you can use SettextEntry().

### 9.2.1 Usage

```
te <- MakeTextEntry(label,x,y,win,width,defaultval)
```

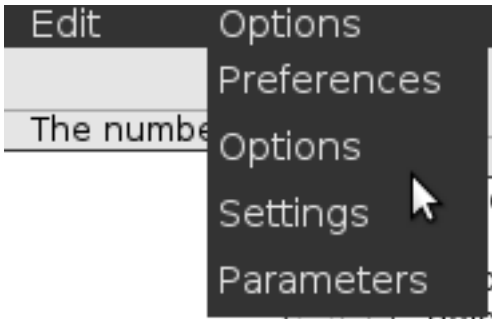

## 9.2.2 Methods and related functions

Below is a list of functions related to TextEntry

	MakeTextEntry(label,x,y,win,width,defaults,copy-layout)	Creates entry layout
Clickon	GetTextEntryInput(obj,event)	Gets text-based input.
Inside	InsideTB(obj,evt)	Tests whether click is inside menu
	SetTextEntry(obj,text)	Sets the value manually

## 9.3 Menu

A Menu appears as a labeled box, and when clicked on a set of options will pull down to be clicked on. When one of this is clicked, a specified function will be executed. Often, you put these on the top of the screen in a menu bar, which needs to be generated manually. See ui-demo.pbl in demo directory for examples.

### 9.3.1 Usage

A menu is created as a set of MenuItems (which is hidden from the user.) Along with specifying the location and text for the items, you need to specify function names to be called when a target is clicked. When clicked, the function gets called with (obj, click), so you can handle the drawing.

```
menu <- "FILE", 10,10,gWin,12,100,["Load","Save","Edit"],  
      ["Loadfile","Savefile","Editfile"])
```

In the example above, a 'FILE' menu will be displayed. When clicked on, subitems 'Load', 'Save', and 'Edit' will appear, which will execute the functions 'Loadfile', 'Savefile', and 'Editfile'.

### 9.3.2 Methods and related functions

Below is a list of functions related to menu creation. The main menu uses a sub-object called menuitem that has its own hide/show methods. You may wish to use a menuitem directly in some cases, but its usage is not documented here.

	MakeMenu(header,x,y,win,fontsize, width,subitems,functions)	Creates menu
Clickon	OpenSubMenus(obj,event)	Opens the menu and accepts clicks on menuitems
Show	ShowMenu(obj,evt)	Shows menu
Hide	HideMenu(obj,evt)	Hides menu
Inside	InsideMenu(obj,evt)	Tests whether click is inside menu
	MakeMenuItem	Helper function
	RemoveMenuItem	Helper function

## 9.4 PullDown

A Pulldown is a list of items that folds up to the chosen item. It is thus simliar to a scrollbox when open, and uses some of the same mechanics.

The important properties of a pulldown are the .selected and .list. The .selected property tells you the index of the currently selected list element. The .list property gives you the list of elements, so that Nth(obj.list,obj.selected) will give you the text of the selected list item.

Open pulldown:

### 9.4.1 Usage

Once created, you can let the `clickon` method handle selection, and then identify `.list` and `.selected` properties when needed. If you need immediate results when selecting something, you will need to reset the `.clickon` property to name your special handler, which should call `PullDown()`.

The `.maxitems` property of a pulldown specifies how many items are shown when the pulldown is open. If there are more than this, it will allow you to scroll through the options. This can be set after the pulldown is created.

```
pulldown <- MakePullDown(["small","medium","large"],
                          gWin,12,120,1)

PullDown(pulldown,[0,0])) ##Simulate click on pulldown
##Suppose you want to update the list:

UpdatePullDown(pulldown,["small","medium","large","extra-large"])
```

## 9.4.2 Methods and related functions

The following methods and related functions operate a pulldown:

	MakePullDown(opts, x,y,win,fontsize, width,selected)	Creates pulldown
Clickon	Pulldown(obj,event)	Opens the menu and accepts clicks on menuitems
Draw	DrawPullDown(obj)	Redraws the pulldown object
Inside	InsidePullDown(obj,evt)	Tests whether click is inside pull- down
	UpdatePullDown	Helper function
	SelectPullDownByText(obj,text)	Tries to select the first item in pulldown that matches text

## 9.5 Button

A Button is created with the MakeButton function, which takes the arguments:

`MakeButton(label,x,y,win,width)`

The button is centered on x,y, and the width (in pixels) must be specified. If the label is too wide for the width, it will be scaled (shrunk) horizontally, which could make it look strange, but less strange that truncating or cutting off the edges.

### 9.5.1 Methods

Button has several methods bound to the following functions:

Clickon	PushButton(obj,event)	Animates a 'click' and returns to normal
Draw	DrawButton(obj)	Draws the graphical elements
Move	MoveButton(obj,x,y)	Moves button to new center loca- tion

### 9.5.2 Usage

Note that by default, the `clickon` method will just simulate a click and do nothing else. To link it to another function, you need to reset the `clickon` property of the button to name your own function. This function should probably call `PushButton`, as shown below. In the main `Start()` function, you might define the button as such:

```
button <- MakeButton("quit",100,100,gWin,150)
button.clickon <- "HandleQuit"
```

then, later, define the function `HandleQuit`:

```
define HandleQuit(button,xy)
{
  PushButton(button,xy)
  ExitQuietly("Exiting the program")
}
```

An example of this is found in `ui-demo.pbl`

## 9.6 Checkbox

A Checkbox is basically a button that has two states, 0 (unchecked) and 1 (checked) In fact, it reuses the methods for a Button. You can interrogate the state of a checkbox with the `.state` property.

### 9.6.1 Usage

Like a button, a checkbox is created with a label, `x,y`, center position, the window, and a width:

```
box <- MakeCheckBox(label,x,y,win,width)
```

Its `.state` property starts at 0 and will appear unchecked, and if the `ClickOn()` method is called, will change to 1 and appear checked (if it is 1, it will change to 0/unchecked). By default, the `clickon` function just changes the state. You may override this with your own custom callback function that has another effect, which may want to call `ClickCheckBox()`. There is also a `SetCheckBox(obj,state)` function you can use to force the state to a specific value.

Typically, this would be used for parameter settings, and when you are ready to 'execute', you would look at the `.state` of the button to decide what to do.

## 9.6.2 Methods and associated functions

The following methods and functions operate a checkbox:

Creation	MakeCheckBox(label,x,y,win,width)	Creation
Clickon	ClickCheckBox(obj,event)	Changes the state of a checkbox
	SetCheckBox(obj,state)	Sets value to specific 0/1 state
Draw	DrawButton(obj)	Draws the graphical elements
Move	MoveButton(obj,x,y)	Moves button to new center location

## 9.7 Scrollbox

This is a workhorse object that lists a bunch of elements, allows selecting, and potentially editing them.

It has several properties of interest: `.list`, which is the list of items in the scrollbox; `.editable`, which determines whether a second-click on an element should permit editing (by calling `EditScrollboxValue`), `.selected`, which specifies the element of the list that is selected.

### 9.7.1 Usage

```
sb <- MakeScrollBox(opts, header,x,y,win,fontsize,
                    width,height,selected)
```

## 9.7.2 Methods and related functions

Below is a list of functions related to ScrollingTextBox

---

	MakeScrollBox(opts,header,x,y,win,font,size,width,height,selected)	Creates scroll box
Clickon	ClickonScrollBox(obj,event)	Handles click
Draw	DrawScrollBox(obj,evt)	Manages drawing
Inside	InsideTB(obj,evt)	Tests whether click is inside scrollbox
	UpdateScrollbox(obj)	Handles updating when .list is changed.
	EditScrollboxValue(win,click, default,selected)	Allows editing of a value, called by clickonscrollbox.
	UpdateCapturedScrollBoxThumb(obj, p)	Allows moving thumb
	ClearScrollboxThumbCapture(obj, p)	Helper; clears capture

---

## 9.8 ScrollingTextBox

A scrolling text box is useful for displaying long text that permits scrolling through. The scrolling UI only appears if the length of the text is longer than the size of the box. It is useful for loading a text file. The `linewrap` argument specifies whether a long line should wrap around or just be truncated at its end. It is based on a scrollbox, which allows selection/action for clicking on specific lines.

### 9.8.1 Usage

```
stb <- MakeScrollingTextBox(text,x,y,win,fontsize,width,height,linewrap)
```

### 9.8.2 Methods and related functions

Below is a list of functions related to ScrollingTextBox

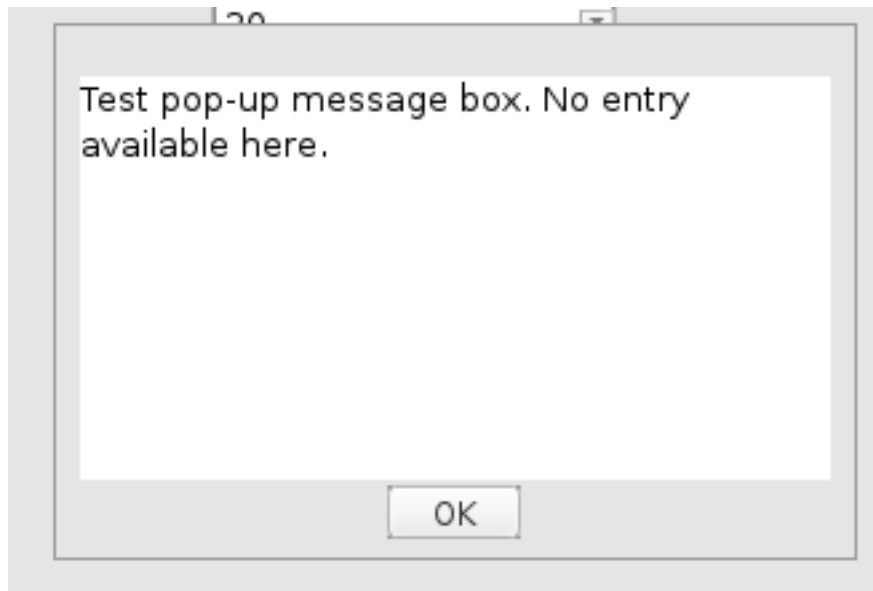

---

	MakeScrollingTextBox(text,x,y,win,fontsize,width,height,linewrap)	Creates scrolling text box
Clickon	ClickonScrollingTextBox(obj,event)	Handles click
Draw	DrawScrollingtextBox(obj,evt)	Manages drawing
Inside	InsideTB(obj,evt)	Tests whether click is inside scrolling textbox
	UpdateScrollingTextBox(obj)	Updates box after elements are changed

---

## 9.9 PopupMessageBox

This create a small pop-up box at the point of the cursor to give a short message. It is dismissed when the user clicks 'OK'.

### 9.9.1 Usage

By default, the message box is 300x200. You can specify width and height arguments to change the size. It will query the location of the mouse and place the box at that location (attempting to stay on the screen).

```
PopupMessageBox("Click OK to continue.",gWin)
```

```
PopupMessageBox("Thank you", gWin,350,250)
```

## 9.10 PopUpEntryBox

This is like a `PopUpMessagBox`, but collects a text entry, exiting when the user hits the enter key. By default it is 300x100 pixels. It will appear at a location specified in an `[x,y]` coordinate list.

### 9.10.1 Usage

```
entry1 <- PopUpEntryBox("Please enter your birthplace",gWin,[100,100])
entry2 <- PopUpEntryBox("Please enter your name",gWin,[100,100],
                        "defaultname",300,200)
```

## Chapter 10

# The PEBL Psychological Test Battery

This chapter contributed by Bryan Rowley in collaboration with Shane Mueller

### 10.1 About the PEBL Test Battery

This site is for a battery of psychological tests implemented in PEBL and distributed (and redistributeable) freely. They are designed to be easily used on multiple computing platforms, running natively under Win32, Linux, and OSX Operating Systems. The tests are designed to implement a wide range of computer-administered psychological tests and experiments of interest to neuropsychological, cognitive, clinical communities.

The current version of the battery is designed to work with PEBL version 2.0 and was released in 2016. It is distributed with PEBL 2.0, and is automatically installed in My Documents\pebl.2.0\battery on windows.

These tests are designed to implement a wide range of tests that are used throughout the psychological, neuropsychological research and clinical communities. Some are reimplementations of tests that are only available on limited computing platforms or cost hundreds of dollars. Each experiment saves the complete data set for later analysis, and many compute basic analyses that it writes in report format.

### 10.2 Setting Parameters of Battery Tests

More details of parameter-setting are available within the next chapter that covers the launcher.

The tests within the battery typically expose the most important instrumentation variables that control important aspects of the test. These often include the number of trials, the make-up of stimuli, etc. For example, the following shows parameters for the ANT test, which is opened when you hit the 'edit' button near the parameters pulldown when you have a parameter-enabled test selected in the file window. In this test, the leftmost column indicates the name of the parameter; the next column indicates its current value, and the final column describes the value along with its default value.

Editing parameters for ./battery/ANT/params/ANT.pbl

Exit without saving    Reset to defaults    Parameters:  
Save file and exit    New parameter set    ANT.pbl.par

iti	4000	Inter-trial interval, in ms. (default: [4000])
showfooter	1	Show/hide footer ("left-shift" and "right-shift")--(showFooter 0 == hide / showFooter 1 == show) (default: [1])
leftresponse	< shift>	Left response key. An alternative value is z. (default: [< shift>])
rightresponse	< rshift>	Right response key. An alternative is / . (default: [< rshift>])
reps	2	Number of repetitions through the design (which is 4 cue conditions x 2 target locations x 2 target directions x 3 flanker conditions (default: [2])
showRT	0	Show/hide reaction time display in practice block (ShowRT <- 0 == hide / gShowRT <- 1 == show) (default: [0])
showNeutralFlankers	0	Show/hide neutral flankers (dashes in the neutral condition) (gShowNeutralFlankers <- 0 == hide / gShowNeutralFlankers <- 1 == show) (default: [0])

If you want to create a custom parameter set, edit these values and click 'Save file and exit'. This will create a default parameter file that will be used. You can also type a new name, and save it, and then select the new name in the parameters pulldown. You can then create an experiment chain and select one parameter set or another to make setup easier and error-free.

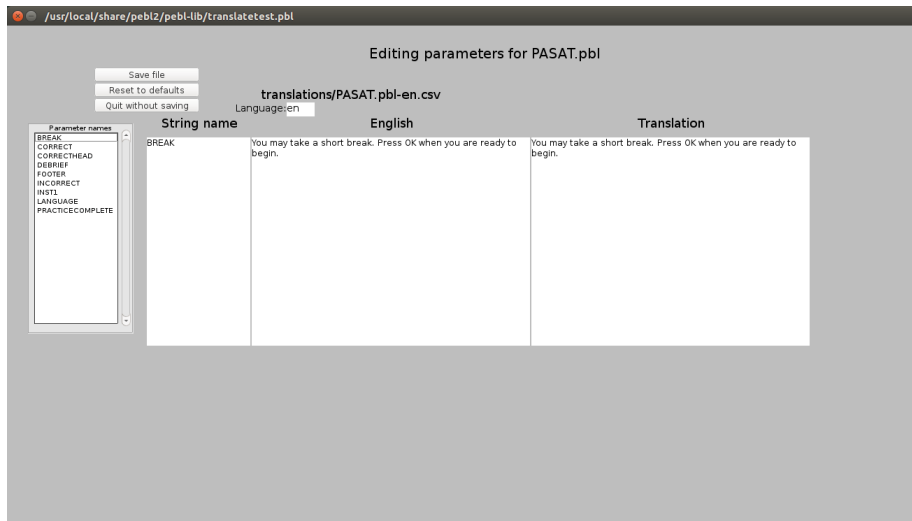

### 10.3 Translating or changing test instructions

Most of the tests within the test battery permit translating any participant-visible text. This usually includes instructions, debriefing, and headers/stimuli/labels. Each test needs to be designed to permit this, but most of the tests in the battery have (most that don't involve primarily English stimuli/materials, such as memory tests).

To translate a test, first be sure the 'language' entry box is named according to the two-letter code associated with your language of choice. By default, it will

## Chapter 10. The PEBL Psychological Test Battery

choose en for English. Then, select the test within the file section scrollbox, and click on the 'translate test' button on the lower right of the window. This will bring up the following screen:

If the language selection is correct, you are fine; otherwise edit the language to be whatever two-letter code you want to use. If you choose en, you will edit the default instructions, and if you make an error you may have to re-copy the translation file from the main PEBL battery directory (i.e., in Program Files(x86) PEBL).

In this dialog, each critical piece of text has a name that is referred to within the testing script. The next column indicates the original text, and the third column is the translated text (which will probably be in English if no translations have been made previously). Select the name on the left, and edit the text on the right. If you want, you can right-click on the window to clear the text or copy in text created elsewhere.

For some languages, this translation dialog may not work—we are still working on improving international keyboard input. In reality, this just edits a .csv file that is stored within the test

translations

directory. For a test called test.pbl, the English file will be called test

translations

test.pbl-en.csv. You can also edit this with a normal text editor or spreadsheet.

To edit by hand, copy the English file to one with a name associated with your chosen language, replacing -en with your language code. Then, edit using either a text editor like notepad++, or a spreadsheet program. Edit only the words within the second column. If you want to add a line break, use \n.

## 10.4 The Tests

The following table describes the basic tests currently implemented in the PEBL Test Battery. Many of them represent the only Free version of proprietary tests available anywhere. They include a free Iowa Gambling Task, a free version of the TOVA®<sup>1</sup>, a free Wisconsin Card Sort Test®<sup>2</sup>, a free version of Conners Continuous Performance task, and a number of other useful tasks, with more to come. All screenshots found on this page are released into the public domain, and can be used for whatever purpose without copyright assignment, including in academic papers. More information on tests is found in the

[PEBL WIKI](#)

Table 1: Test Battery

PEBL Test/Version of:	Description
<p><a href="#">Bechera's Gambling Task</a> (version of Bechera's Iowa Gambling Task <sup>®</sup> <a href="#">wikipedia</a>)</p> 	<p>Choose from four decks, each choice with a cost and each providing reward. Used for tests of executive control.</p> <p><b>Key Skills used:</b> Decision Making, Strategy and Problem Solving, Risk Assessment.</p> <p><b>Note:</b> the task requires individuals to decide on which deck to choose from, with the chance of losing in the process. Test can be modified to ask individual to achieve a certain amount of money.</p>
<p><a href="#">The "Hungry Donkey" Task</a> A version of Bechera's Gambling Task for children</p> 	<p>The donkey chooses from four doors, each door has a cost and reward in apples. Used for tests of executive control.</p> <p><b>Key Skills used:</b> Fine-motor skills, Visual processing.</p> <p><b>Note:</b> Test can be modified to ask individual to reach a certain number of apples (i.e. 10 apples) in a certain amount of time.</p>
<p><a href="#">TOAV: Test of Attentional Vigilance</a> A Version of TOVA<sup>®</sup>: Test of Variables of Attention <a href="#">wikipedia</a></p> 	<p>22-minute test requiring subject to detect a rare visual stimulus (top or bottom). Used to diagnose ADD, ADHD, etc.</p> <p><b>Key Skills used:</b> Concentration, Reaction Time, Attention</p> <p><b>Note:</b> This task requires the individual to concentrate for an extended period of time. Thus, the extent to which their reaction time scores alter through the duration of this test can be indicative of how their attention levels have been affected.</p>

PEBL Test/Version of:	Description
<a href="#">PEBL Continuous Performance Test</a> Version of Conners CPT <a href="#">wikipedia</a>	14-minute vigilance test requiring subject respond to non-matches. Used to diagnose ADD, ADHD, etc. <b>Key Skills Used:</b> Reaction Time, Attention, Concentration. <b>Note:</b> The test length allows for observation of how their results change overtime (i.e. attention levels altering).
	
<a href="#">PEBL Perceptual Vigilance Task (PPVT)</a> Wilkinson & Houghton's Psychomotor Vigilance Task <a href="#">wikipedia</a>	A vigilance task used to detect vigilance and sleep lapses. <b>Key Skills Used:</b> Reaction Time, Attention, Concentration. <b>Note:</b> The individual's results can be viewed in data section, and we can observe how their performance declines or improves throughout test duration.
	
<a href="#">Berg's Card Sorting Test</a> version of Berg's (1948) Wisconsin Card Sorting Test <a href="#">wikipedia</a>	Sort multi-attribute cards into piles according to an unknown and changing rule. <b>Key Skills used:</b> Strategy and Problem Solving, Decision Making, Inhibition, Working Memory. <b>Note:</b> The results from the data section provide an indication of which rule (shape, color or number) is easiest for the individual via reaction time. We are able to see how the individual's working memory is operating by their ability to recall which rule is active (via correct responses).
	

PEBL Test/Version of:	Description
<a href="#">Simple Response Time</a> <a href="#">wikipedia</a> 	<p>Detect the presence of a visual stimulus, as quickly and accurately as possible.</p> <p><b>Key Skills Used:</b> Reaction Time, Attention, Fine Motor Skills.</p> <p><b>Note:</b> The task allows for observation of how their attention and reactivity alter throughout the test's duration. The individual can also work on their executive control and fine motor ability.</p>
<a href="#">Digit Span</a> A component of many intelligence tests <a href="#">wikipedia</a> 	<p>Remember a sequence of digits.</p> <p><b>Key Skills Used:</b> Working Memory, Numerical Processing, Short Term Memory.</p> <p><b>Note:</b> Primacy, Recency effects can be observed in this task (i.e. which numbers in the set are being remembered, first numbers or last numbers).</p>
<a href="#">Partial Report Procedure</a> Lu et al.'s (2005) update of Sperling's iconic memory procedure. <a href="#">wikipedia</a> 	<p>May provide an early-warning sign for Alzheimer's.</p> <p><b>Key Skills used:</b> Reaction Time, Decision Making, Working Memory.</p> <p><b>Note:</b> Individuals are required to make quick decision based on a brief stimulus shown. Not recommended for people with slow reaction times.</p>

PEBL Test/Version of:	Description
<p><a href="#">Implicit Association Test</a></p> <p>A test of automatic associations between memory representations. <a href="#">wikipedia</a></p> 	<p>Tests association between two sets of binary classifications.</p>
<p><a href="#">Tower of London</a></p> <p>Traditional problem solving/planning task</p> <p><a href="#">wikipedia</a></p> 	<p>Tests ability to make and follow plans in problem solving task.</p> <p><b>Key Skills Used:</b> Strategy and Problem Solving, Color Processing, Hand-eye coordination, Fine Motor Skills.</p> <p><b>Note:</b> Test cannot be completed successfully for color-blind individuals. Task is great for individuals trying to improve on executive control, and requires both strategy and problem solving skills to complete successfully.</p>
<p><b>Symbol Counter Task</b></p> <p>Garavan (2000) counter task</p> 	<p>Useful indicator of executive control.</p> <p><b>Key Skills used:</b> Reaction Time, Working Memory, Selective Attention.</p> <p><b>Note:</b> We can view if the individual will be able to recall which symbols are associated with which shift tab (i.e. a measure of working memory via correct responses).</p>

PEBL Test/Version of:	Description
<a href="#">Four choice response time</a> Wilkinson & Houghton's 4-choice response time <a href="#">wikipedia</a> 	Respond to a plus sign that appears in one of four corners of the screen. <b>Key Skills used:</b> Reaction Time, Selective Attention, Visual Processing. <b>Note:</b> the task measures how quickly the individual's attention leads them to the correct location, combining visual processing abilities with reaction time.
<a href="#">Time Wall</a> UTCPAB's Time wall 	Estimate the time when a moving target will reach a location behind a wall. <b>Key Skills Used:</b> Reasoning, Calculating, Reaction Time, Strategy and Problem Solving. <b>Note:</b> this task requires tracking of an object after its disappearance. It requires the individual to in a sense to imagine the location of this object using precise calculating (of object's speed).
<a href="#">PEBL Compensatory Tracker</a> Similar to Makeig & Jolley's <a href="#">CompTrack</a> 	Use mouse/trackball to keep a randomly moving target inside a bullseye. <b>Key Skills used:</b> Fine Motor Skills, Strategy and Problem Solving, Hand Eye Coordination. <b>Note:</b> this task can be helpful for individuals wanting to get better with using a mouse for the computer.

PEBL Test/Version of:	Description
<a href="#">Lexical Decision</a> Meyer & Schvaneveldt's LDT <a href="#">wikipedia</a>	Determine whether a stimulus is a word or nonword. <b>Key skills used:</b> Linguistic Processing, Language Processing. <b>Note:</b> the words are able to be changed for the test. They can be changed to fit closely to an individual's expertise (ex. If individual is aphasic but has an interest in bands, the words can be altered to include words of bands they listen to frequently).
<a href="#">Mental Rotation</a> Shepard's mental rotation task <a href="#">wikipedia</a>	Determine whether two figures are identical, subject to rotation. <b>Key Skills used:</b> Reasoning, Visual Processing, Decision Making. <b>Note:</b> while observing both objects, the individual is required to make a decision of whether the objects are similar, and requires precise reasoning due to their similarities (i.e. be able to reason that object on left looks identical to the object on the right, only inverted from the object on the right)
<a href="#">Matrix Rotation</a> Version of UTC test battery matrix rotation	Determine whether a 6x6 matrix is the same (with rotation) as another. <b>Key skills used:</b> Selective Attention, Working Memory, Visual Processing. <b>Note:</b> Working Memory is being tested, we can see how individual's object manipulation or 'visuo-spatial sketchpad' is operating (I.e. correct responses being a measure of working memory, and the 'sketchpad' the specific component being measured).

PEBL Test/Version of:	Description
<a href="#">Spatial Cueing</a> Posner's attentional cueing (spotlight) task. <a href="#">wikipedia</a> 	Given a probabilistic cue of where a stimulus will appear, respond as fast as possible. <b>Key Skills used:</b> Selective Attention, Inhibition. <b>Note:</b> this task tests the individual's ability to make the correct response regardless of the correct cue or the distracter cue. We can view how the distracter cue affects the individual via correct responses and reaction time.
<a href="#">Two column addition</a> UTC test battery's 2-column addition. 	Add three two-digit numbers and respond quickly and accurately. <b>Key Skills Used:</b> Mathematical Processing, Numerical Processing, Working Memory. <b>Note:</b> it is important to distinguish between Mathematical and Numerical, as mathematical processing in this test refers to the manipulation of numerical information, whereas numerical processing refers to the knowledge of numerical information (i.e. the understanding that the number 'one' means '1'.)
<a href="#">Stroop task</a> Stroop's attention task <a href="#">wikipedia</a> 	Respond to either the color or name of stimuli. <b>Key Skills Used:</b> Inhibition, Selective Attention. <b>Note:</b> Reaction Time is recorded in the data section, allowing for analysis of which trials are easiest, and which are most challenging.

PEBL Test/Version of:	Description
<a href="#">PEBL Manual Dexterity</a> 	<p>Move a noisy cursor to the target.</p> <p><b>Key Skills used:</b> Fine Motor Skills, Strategy and Problem Solving, Hand-eye Coordination.</p> <p><b>Note:</b> This task is helpful for individuals trying to improve their mouse ability with the computer.</p>
<a href="#">PEBL Trail-making test</a> Version of Reitan's (1958) Trail-making A and B tests. <a href="#">wikipedia</a>	<p>Connect the dots task.</p> <p><b>Key Skills used:</b> Language Processing, Numerical Processing, Hand-eye coordination.</p> <p><b>Note:</b> this task tests both linguistic and numerical processing, and tests the individual's ability to navigate to the correct location (i.e. visual processing).</p>
	
<a href="#">Aimed Movement (Fitts's Law) test</a> <a href="#">wikipedia</a>	<p>Mouse-driven implementation of classic perceptual-motor task.</p> <p><b>Key Skills used:</b> Hand-eye coordination, Fine Motor Skills, Concentration.</p> <p><b>Note:</b> The number of trials (105) requires continuous concentration on the participants' behalf.</p>
	

PEBL Test/Version of:	Description
<p><a href="#">Pursuit Rotor task</a> Classic mechanical test device</p> 	<p>Mouse-driven motor pursuit.</p> <p><b>Key Skills used:</b> Hand –eye coordination, Fine Motor Skills, Strategy and Problem Solving.</p> <p><b>Note:</b> The task requires the individual to adapt to the rate at which the circle is moving, thus requiring incorporation of a calculating strategy to complete successfully.</p>
<p><a href="#">Match to sample task</a> Classic non-visual short-memory task</p> 	<p>Match a matrix pattern to one presented after a delay.</p> <p><b>Key Skills used:</b> Reasoning, Calculating, Color-processing.</p> <p><b>Note:</b> color-blind individuals will not be as successful in this task.</p>
<p><a href="#">Corsi block test</a> Version of physical "Corsi block-tapping test"</p> 	<p>Measure of visual-spatial working memory.</p> <p><b>Key Skills used:</b> Working Memory, Visual Processing.</p> <p><b>Note:</b> reaction time can be measured in the trails varying in length.</p>

PEBL Test/Version of:	Description
<p><a href="#">Change Detection test</a></p> <p>Version of numerous change blindness paradigms</p> 	<p>Assess whether participant sees change in a display of colored circles.</p> <p><b>Key Skills used:</b> Selective attention, Visual processing, Concentration.</p> <p><b>Note:</b> the changing object may not be so obvious at first, so additional concentration may be required.</p>
<p><a href="#">Clock Test</a></p> <p>Mackworth's Sustained attention test</p> 	<p>Watch a clock, and respond whenever it skips a beat.</p> <p><b>Key Skills used:</b> Selective attention.</p> <p><b>Note:</b> Reaction Time is revealed in the data section, indicating the individual's attention levels as the task progresses.</p>
<p><a href="#">Device Mimicry Test</a></p> 	<p>Operate a 4-df etch-a-sketch to recreate paths produced by the computer.</p> <p><b>Key Skills used:</b> Calculating, Hand-eye coordination, concentration, Fine Motor Skills, Strategy and Problem Solving.</p> <p><b>Note:</b> This task requires precision to complete successfully. Test can be very helpful for individual's trying to improve their computer skills, or in cognitive rehabilitation sessions.</p>

PEBL Test/Version of:	Description
<a href="#">Item-Order Test</a> 	Assess two consecutive letter strings, and determine whether they are the same or different. Different trials are created either by changing identity of a letter or the order of two adjacent letters. <b>Key Skills used:</b> Language Processing, Working Memory. <b>Note:</b> Does the duration of the test result in better or poorer performance? This can be measured in the data section.
<a href="#">Letter-Digit substitution</a> Version of UTC-PAB and Wechsler tests 	Recode stimuli according to a letter-digit code chart. <b>Key Skills used:</b> Language Processing, Numerical Processing. <b>Note:</b> great test to use with Aphasiac patients to see how they map language information with mathematical information. Reaction time revealed in data section.
<a href="#">Math Processing</a> 	Do simple arithmetic problems. <b>Key Skills used:</b> Mathematical processing, Numerical processing, Reaction Time. <b>Note:</b> Important to distinguish between mathematical and numerical processes, as the former refers to the manipulation of numerical information, and the latter refers to basic processing of numerical information (i.e. that '1' means 'one').

PEBL Test/Version of:	Description
<p><a href="#">Memory Span (Visual)</a></p> <p>Classic experimental paradigm</p> 	<p>See a sequence of items, then respond using mouse or touchscreen.</p> <p><b>Key Skills used:</b> Working Memory, Short Term Memory, Visual Processing.</p> <p><b>Note:</b> Individuals familiarity with certain objects may result in better recall for those objects (i.e. animal lovers).</p>
<p><a href="#">Object Judgment</a></p> 	<p>Determine whether two polygons are identical, while manipulating shape, orientation, size.</p> <p><b>Key Skills used:</b> Calculating, Reasoning, Visual Processing.</p> <p><b>Note:</b> may require concentration due to the duration of task. Task requires visual manipulation of the stimuli presented.</p>
<p><a href="#">Pattern Comparison Test</a></p> 	<p>Examine two grid patterns and determine whether they are the same.</p> <p><b>Key Skills used:</b> Calculating, Visual Processing.</p> <p><b>Note:</b> pattern-samediff.pbl requires reaction time (found in data section), while pattern-sequential.pbl requires working memory to function (via correct responses).</p>

PEBL Test/Version of:	Description
<p><a href="#">Probability Monitor</a></p> 	<p>Watch a set of gauges to determine when one gets a hit.</p> <p><b>Key Skills used:</b> Calculating, Inhibition, Visual Processing, Reasoning.</p> <p><b>Note:</b> while trying to detect a pattern (calculating and reasoning), the individual is required to inhibit other random dials on later trails (trials 2 and 3). Reaction time is measured in data section.</p>
<p><a href="#">Situation Awareness Test</a></p> 	<p>Watch a set of moving targets and respond to probes about their locations and identities.</p> <p><b>Key Skills used:</b> Selective Attention, Working Memory, Visual Processing.</p> <p><b>Notes:</b> Test great for combining visual awareness with working memory.</p>
<p><a href="#">Comfort scales</a></p> 	<p>Respond to four visual-analytic scales about different dimensions of comfort.</p> <p><b>Key Skills used:</b> Linguistic Processing, Calculating.</p> <p><b>Note:</b> Allows for extensive self reflection, and requires linguistic ability for responses (to indicate how they feel).</p>

PEBL Test/Version of:	Description
<p><a href="#">Speed tapping test</a> Version of Reitan test battery</p> 	<p>Tap a key as quickly as possible. <b>Key Skills used:</b> Fine Motor Skills. <b>Note:</b> can be used for individuals in rehabilitation sessions.</p>
<p><a href="#">Time tapping test</a></p> 	<p>Tap for a production period at a prespecified pace. <b>Key Skills used:</b> Calculating, Working Memory. <b>Note:</b> requires individual to recall and implement the pace at which they are required to tap.</p>
<p><a href="#">Tower of Hanoi test</a> Classic puzzle and cognitive test of planning</p> 	<p>Solve game with disks. <b>Key Skills used:</b> Calculating, Reasoning, Hand-eye coordination, Fine Motor Skills, Working Memory, Visual Processing, Strategy and Problem Solving. <b>Note:</b> Able to track the individual's number of moves. Task is very great for a multitude of cognitive abilities, and is helpful for patients with cognitive disorders.</p>

PEBL Test/Version of:	Description
<p><a href="#">Two-column addition</a></p> 	<p>Do mental arithmetic of at least three two-digit summands.</p> <p><b>Key Skills used:</b> Mathematical Processing, Working Memory, Calculating.</p> <p><b>Note:</b> Individual can be asked how they decided to solve the problems (i.e. with what strategy: first column then the next two columns, or adding all the numbers at once etc.)</p>
<p><a href="#">Visual Search</a></p> 	<p>Find the target amidst clutter.</p> <p><b>Key Skills used:</b> Language Processing, Visual Processing, Selective Attention, Colour Processing, Inhibition, Concentration.</p> <p><b>Note:</b> X's and O's are quite distinguishable letters. O's look more similar to the other letters than X does, and therefore the trials with X's and O's can be compared to see which ones are easier (via correct response or not) and found quicker (via reaction time).</p>
<p><a href="#">Attentional Network Task</a></p> <p>Version of Fan et al.'s ANT</p> 	<p>Assess three types of attention.</p> <p><b>Key Skills used:</b> Selective Attention, Reaction Time, Inhibition.</p> <p><b>Note:</b> The data section reveals trial and the corresponding reaction times. Can be viewed is how their attention processes alter through the test's duration.</p>

PEBL Test/Version of:	Description
<a href="#">PEBL Balloon Analog Risk Task</a> Version of LeJuez et al's BART	<p>Assess three types of attention.</p> <p><b>Key Skills used:</b> Risk Assessment and risk aversion.</p> <p><b>Note:</b> Test can be modified to ask the participant to reach a certain money value in a set amount of time.</p>
	
<a href="#">Dot Judgment Task</a> Determine which field has more dots.	<p><b>Key Skills used:</b> Calculating, Decision Making</p> <p><b>Note:</b> Threshold provides an opportunity to observe how the individual performs (with correct judgment) when dot amounts are similar.</p>
	
<a href="#">Flanker Task</a> Eriksen's Flanker Task	<p>Make direction response with distraction.</p> <p><b>Key Skills used:</b> Selective Attention, Reaction Time, Inhibition.</p> <p><b>Note:</b> The data section reveals trial and the corresponding reaction times. Can be viewed is how their attention processes progress through the test's duration.</p>
	

PEBL Test/Version of:	Description
<p><a href="#">Go/No-go Task</a> Version of Bezdjian's 2009 Implementation</p> 	<p>Classic continuous performance task. <b>Key Skills used:</b> Inhibition, Reaction Time, Language Processing, Selective attention. <b>Note:</b> The data section allows for observation of their scores, and to view if their inhibition skills are increasing or decreasing with time.</p>
<p><a href="#">Manikin Task</a></p> 	<p>Assess mental rotation.</p>
<p><a href="#">TLX Workload Assessment</a>  An implementation of NASA's TLX workload assessment <a href="#">wikipedia</a></p> 	<p>Assess workload of task on multiple dimensions. <b>Key Skills used:</b> Concentration, Linguistic Processing, Calculating. <b>Note:</b> requires the individual to self reflect, read the information, and calculate their levels according to the scale provided.</p>

---

PEBL Test/Version of:	Description
<a href="#">Muller-Lyer Illusion</a> Classic perceptual illusion <a href="#">wikipedia</a>	Psychometric study of Illusion. <b>Key Skills used:</b> Calculating, Reaction Time. <b>Note:</b> the task requires a quick response, thus attention abilities can be hard to measure in this task.
	
<a href="#">Oddball Task</a> Version of Huettel's implementation	Respond to a stimulus dimension overshadowed by irrelevant dimension. <b>Key Skills used:</b> Inhibition, Selective Attention, Visual Processing, Reaction Time. <b>Note:</b> Inhibition skills require the individual to ignore the location and instead focus on the shape differences.
	
<a href="#">Simon Task</a> Simon's S-R compatibility test	Respond to a stimulus dimension, overshadowed by spatial location. <b>Key Skills used:</b> Color Processing, Inhibition, Visual Processing, Selective Attention, Reaction Time. <b>Note:</b> those who are color blind will have difficulty in completing this task. Individual's inhibition abilities can be measured (via correct responses) to see how well they can focus on the point of the task (color) and not be distracted by its location.
	

PEBL Test/Version of:	Description
<a href="#">Switcher Task</a> 	Respond to a matched and changing stimulus dimension. <b>Key Skills used:</b> Visual Processing, Selective Attention. <b>Note:</b> reaction time is measured in the data section, along with trail type. Thus, times associated with color, shape and letter can be measured to see which is easiest and most challenging for the individual.

### Norms and Other Uses

Many of the original versions of the tasks we implement here have been normed on a large population. Such norms are available in published articles. Because these implementations are not identical (many of them use slightly different stimuli, response methods, timing, etc.) one must be careful when applying the results to the normed data. If you use PEBL or the PEBL Psychological Test Battery, please reference us! If you are interested in helping develop norms for PEBL tests, have access to subject populations and testing facilities, join the [pebl-norms@lists.sourceforge.net](mailto:pebl-norms@lists.sourceforge.net) mailing list and tell us what norms you are most interested in.

### Support and Contact info

If you have any general questions about PEBL or the PEBL Psychological Test Battery, you can contact us at: [pebl-list@lists.sourceforge.net](mailto:pebl-list@lists.sourceforge.net). Email support is available free-of-charge. You can sign up for this [email list or browse the archives here](#). More information about the [main author is available here](#). Enquire on the list if you are interested in paying someone to write new experiments or modify existing ones for your needs.

**Obtaining the Battery** The PEBL Test Battery is installed with the main PEBL installation. The first time you run PEBL, it will be copied into a folder in your Documents directory called pebl-exp.2.0 (or similar depending on the version of PEBL you are running). On Linux, running `> pebl -install` will copy the battery directory there. The PEBL launcher will start in that directory, and let you explore and navigate the different tests in the battery.

<http://pebl.sourceforge.net/battery.html>

## Chapter 11

# Detailed Function and Keyword Reference

Welcome to the PEBL Function Reference. This documentation covers all functions available in the Psychology Experiment Building Language.

PEBL functions are organized by namespace. Click on any namespace below to see its functions:

### **Built-in Function Namespaces:**

- *PEBLEnvironment* - *System and Environment*
- *PEBLList* - *List Manipulation*
- *PEBLMath* - *Mathematical*
- *PEBLObjects* - *Graphics and Objects*
- *PEBLStream* - *File and Network I/O*
- *PEBLString* - *String Manipulation*

### **PEBL Library Functions:**

- *Design Library* - *Experimental Design*
- *Graphics Library* - *Advanced Graphics*
- *HTML Library* - *HTML Generation*
- *Math Library* - *Extended Mathematical*
- *UI Library* - *User Interface*
- *Utility Library* - *Helpers and Utilities*

## 11.1 PEBLEnvironment - System and Environment

This module contains functions for system interaction, timing, input/output, and environment management.

### Function Index

- *ClearEventLoop()*
- *CopyFromClipboard()*
- *CallFunction()*
- *CheckProcessStatus()*
- *DeleteFile()*
- *ExitQuietly()*
- *FileExists()*
- *GetCurrentScreenResolution()*
- *GetDirectoryListing()*
- *GetDrivers()*
- *GetExecutableName()*
- *GetHomeDirectory()*
- *GetJoystickAxisState()*
- *GetJoystickBallState()*
- *GetJoystickButtonState()*
- *GetJoystickHatState()*
- *GetMouseCursorPosition()*
- *GetMouseState()*
- *GetNumJoystickAxes()*

### 11.1.1 ClearEventLoop()

*Clears all trigger events from event loop*

**Description:**

Clears the event loop. This function is currently experimental, and its usage may change in future versions of PEBL.

**Usage:**

```
## shows a way to generate custom WaitForMouseButton
RegisterEvent("<MOUSE_BUTTON_PRESS>",1,1,"<EQUAL>", "", [])
out <- StartEventLoop()
ClearEventLoop()
```

**See Also:**

RegisterEvent(), StartEventLoop()

### 11.1.2 CopyFromClipboard()

*Copies text from system clipboard.*

**Description:**

This copies text currently living in the system clipboard. Note that (depending on platform), text copied into the clipboard may not remain there after PEBL exits.

**Example:**

```
text <- CopyFromClipboard()
textbox.text <- text
```

**See Also:**

CopyToClipboard()

### 11.1.3 CallFunction()

*Calls a PEBL function by name with a list of arguments*

**Description:**

Calls a PEBL function dynamically using its name as a string and a list of arguments. This is useful for implementing callbacks, event handlers, or calling functions whose names are determined at runtime.

**Usage:**

```
CallFunction(<function_name>, <argument_list>)
```

**Example:**

```
## Call a function by name
result <- CallFunction("Max", [1, 5, 3, 2])
Print(result) # == 5

## Use for callbacks
myCallback <- "ProcessResponse"
CallFunction(myCallback, [response, rt])
```

**See Also:**

PropertyExists(), MakeCustomObject()

### 11.1.4 CheckProcessStatus()

*Checks if a background process is still running*

**Description:**

Checks the status of a background process launched with SystemCall(). Takes a process ID (PID) as an argument and returns 1 if the process is still running, 0 if it has finished, or -1 if there was an error checking the status. This is only available on Unix/Linux systems and requires the process to have been launched from within PEBL.

**Usage:**

```
CheckProcessStatus(<pid>)
```

**Example:**

```
##Launch a background process (Unix only)
pid <- SystemCall("sleep 5 &")

##Check if it's still running
status <- CheckProcessStatus(pid)
if(status == 1)
{
  Print("Process still running")
} elseif(status == 0) {
  Print("Process finished")
} else {
```

(continues on next page)

(continued from previous page)

```
    Print("Error checking process")
}
```

**See Also:**

SystemCall(), GetSystemType()

### 11.1.5 DeleteFile()

*Deletes a file*

**Description:**

Deletes a file from the file system.

**Usage:**

```
DeleteFile( <filename>)
```

**Example:**

```
tmpfile <- FileOpenWrite("tmp.txt")
FilePrint(tmpfile, Random())
FileClose(tmpfile)
text <- FileReadText("tmp.txt")
DeleteFile("tmp.txt")
```

**See Also:**

GetDirectoryListing(), FileExists(), IsDirectory(), MakeDirectory()

### 11.1.6 ExitQuietly()

**Description:**

Stops PEBL and prints <message> to stderr. Unlike SignalFatalError, it will NOT pop-up a window with the error message. Useful exiting a study or application without causing a popup error message.

**Usage:**

```
ExitQuietly(<message>)
```

**Example:**

```
If(response == "exit")
{
    ExitQuietly("Exiting study.")
}
##Prints out error message and
##line/filename of function
```

**See Also:**

MessageBox, Print(), SignalFatalError()

### 11.1.7 FileExists()

*Checks whether a file exists*

**Description:**

Checks whether a file exists. Returns 1 if it exists, 0 otherwise.

**Usage:**

```
FileExists(<path>)
```

**Example:**

```
filename <- "data-"+gSubNum+".csv"
exists <- FileExists(filename)
if(exists)
{
    MessageBox("Subject file already exists. "+
    " Please try a new one.",gWin)
    SignalFatalError("filename already used")
}
```

**See Also:**

GetDirectoryListing(), FileExists(), IsDirectory(), MakeDirectory()

### 11.1.8 GetCurrentScreenResolution()

**Description:**

Returns an list of [width,height] specifying what the current computer screen resolution is. This is used within the pebl launcher in order to use the current resolution to run the experiment.

**Usage:**

```
res <- GetCurrentScreenResolution()
```

**Example:**

```
define Start(p)
{
    ## For testing, let's make the screen resolution a bit
    ↪ smaller than the
    ## current one so that it doesn't get hidden by the bottom
    ↪ task bar
    ##
    res <- GetCurrentScreenResolution()
    gVideoWidth <- First(res)-100
    gVideoHeight <- Second(res)-100
    gWin <- MakeWindow()
    MessageBox("Window slightly smaller than screen",gWin)
}
```

**See Also:**

GetVideoModes()

### 11.1.9 GetDirectoryListing()

*Returns a list of all the files/subdirectories in a path*

**Description:**

Returns a list of files and directories in a particular directory/folder.

**Usage:**

```
list <- GetDirectoryListing(<path>)
```

**Example:**

```
files <- GetDirectoryListing("./")
```

**See Also:**

GetDirectoryListing(), FileExists(), IsDirectory(), MakeDirectory()

### 11.1.10 GetDrivers()

*Gets a list of possible video drivers*

**Description:**

Gets a list of video drivers on the current platform. This is usually one of opengl, opengles, software, and directx, different ones of which are available on different platforms. This is most useful for building launchers, although it could be used within a script *before* MakeWindow is called to choose the best available driver.

**Usage:**

```
drivers <- GetDrivers()
```

**See Also:**

GetCurrentScreenResolution(), gVideoWidth(), gVideoHeight(),  
GetVideoModes()

### 11.1.11 GetExecutableName()

*Returns the name/path of the PEBL executable*

**Description:**

This function signals a fatal error directing users to use the global variable gExecutableName instead. The executable name is set at program startup and stored in this global variable.

**Usage:**

```
name <- gExecutableName ##Use this global variable instead
```

**See Also:**

GetSystemType(), GetWorkingDirectory()

### 11.1.12 GetHomeDirectory()

*Returns the user's home directory path*

**Description:**

Returns the path to the current user's home directory. This is platform-specific and will return different values on Windows, Linux, and Mac OS.

**Usage:**

```
GetHomeDirectory()
```

**Example:**

```
homedir <- GetHomeDirectory()
Print("User home directory: " + homedir)
```

**See Also:**

`GetWorkingDirectory()`, `SetWorkingDirectory()`, `GetDirectoryListing()`

### 11.1.13 GetJoystickAxisState()

*Gets the state of a joystick axis*

**Description:**

This gets the state of a particular joystick axis. You need to specify a joystick object, which is created with `OpenJoystick()`. You also need to specify the axis. You can determine how many axes a joystick has with the `GetNumJoystickAxes()` function. The function returns a value between 1 and 32768.

**See Also:**

`GetNumJoysticks()`, `OpenJoystick()`, `GetNumJoystickAxes()` `GetNumJoystickBalls()`, `GetNumJoystickButtons()`, `GetNumJoystickHats()` `GetJoystickAxisState()`, `GetJoystickHatState()`, `GetJoystickButtonState()`

### 11.1.14 GetJoystickBallState()

*Gets the state of a joystick ball*

**Description:**

Not implemented.

**See Also:**

`GetNumJoysticks()`, `OpenJoystick()`, `GetNumJoystickAxes()` `GetNumJoystickBalls()`, `GetNumJoystickButtons()`, `GetNumJoystickHats()` `GetJoystickAxisState()`, `GetJoystickHatState()`, `GetJoystickButtonState()`

### 11.1.15 GetJoystickButtonState()

**Description:**

This gets the state of a particular joystick button. You need to specify a joystick object, which is created with `OpenJoystick()`. You also need to specify the button. You can determine how many buttons a joystick has with the `GetNumJoystickButtons()` function. The function returns either 0 (for unpressed) or 1 (for pressed).

**See Also:**

`GetNumJoysticks()`, `OpenJoystick()`, `GetNumJoystickAxes()` `GetNumJoystickBalls()`, `GetNumJoystickButtons()`, `GetNumJoystickHats()` `GetJoystickAxisState()`, `GetJoystickHatState()`, `GetJoystickButtonState()`

### 11.1.16 GetJoystickHatState()

*Gets the state of a joystick hat*

**Description:**

`GetJoystickHatState(js,1)` This gets the state of a particular joystick hat. You need to specify a joystick object, which is created with `OpenJoystick()`. You also need to specify the hat id. You can determine how many hats a joystick has with the `GetNumJoystickHats()` function. The function returns a value between 0 and 15, which is the sum of values specifying whether each primary NSEW direction is pressed. The coding is: 0=no buttons; 1=N, 2=E, 4=S, 8=W. Thus, if 1 is returned, the north hat button is pressed. If 3 is returned, NorthEast. If 12 is returned, SW, and so on.

**See Also:**

`GetNumJoysticks()`, `OpenJoystick()`, `GetNumJoystickAxes()` `GetNumJoystickBalls()`, `GetNumJoystickButtons()`, `GetNumJoystickHats()` `GetJoystickAxisState()`, `GetJoystickHatState()`, `GetJoystickButtonState()`

### 11.1.17 GetMouseCursorPosition()

**Description:**

Gets the current x,y coordinates of the mouse pointer.

**Usage:**

`GetMouseCursorPosition()`

**Example:**

```
pos <- GetMouseCursorPosition()
```

**See Also:**

ShowCursor(), WaitForMouseButton(), SetMouseCursorPosition(),  
GetMouseCursorPosition()

### 11.1.18 GetMouseState()

*Gets [x,y,b1,b2,b3] list of mouse state, including button states*

**Description:**

Gets the current x,y coordinates of the mouse pointer, plus the current state of the buttons. Returns a 5-element list, with the first two indicating x,y position, the third is either 0 or 1 depending on if the left mouse is clicked, the fourth 0 or 2 depending on whether the middle mouse is clicked, and the fifth either 0 or 4 depending on whether the right mouse is clicked.

**Example:**

```
define Start(p)
{
    win <- MakeWindow()
    i <- 1
    while(i < 100)
    {
        Draw()
        Print(GetMouseState())

        Wait(100)
        i <- i + 1
    }
}

##Returns look like:
[417, 276, 0, 0, 0]
[495, 286, 0, 0, 0]
[460, 299, 0, 0, 0]
[428, 217, 0, 0, 0]
[446, 202, 0, 0, 4]
[446, 202, 1, 0, 0]
[446, 202, 1, 0, 0]
[446, 202, 0, 2, 0]
```

**See Also:**

ShowCursor()      WaitForMouseButton(),      SetMouseCursorPosition(),  
GetMouseCursorPosition()

### 11.1.19 GetNumJoystickAxes()

*Counts how many axes on a joystick*

**Description:**

This gets the number of axes on a joystick. You need to specify a joystick object, which is created with OpenJoystick().

**See Also:**

GetNumJoysticks(), OpenJoystick(), GetNumJoystickAxes() GetNumJoystickBalls(), GetNumJoystickButtons(), GetNumJoystickHats() GetJoystickAxisState(), GetJoystickHatState(), GetJoystickButtonState()

### 11.1.20 GetNumJoystickBalls()

*Counts how many balls on a joystick*

**Description:**

This gets the number of joystick balls available on a particular joystick. You need to specify a joystick object, which is created with OpenJoystick().

**See Also:**

GetNumJoysticks(), OpenJoystick(), GetNumJoystickAxes() GetNumJoystickBalls(), GetNumJoystickButtons(), GetNumJoystickHats() GetJoystickAxisState(), GetJoystickHatState(), GetJoystickButtonState()

### 11.1.21 GetNumJoystickButtons()

**Description:**

This gets the number of joystick buttons available on a particular joystick. You need to specify a joystick object, which is created with OpenJoystick().

**See Also:**

GetNumJoysticks(), OpenJoystick(), GetNumJoystickAxes() GetNumJoystickBalls(), GetNumJoystickButtons(), GetNumJoystickHats() GetJoystickAxisState(), GetJoystickHatState(), GetJoystickButtonState()

### 11.1.22 GetNumJoystickHats()

*Counts how many hats on a joystick*

**Description:**

This gets the number of hats available on a particular joystick. You need to specify a joystick object, which is created with `OpenJoystick()`.

**See Also:**

`GetNumJoysticks()`, `OpenJoystick()`, `GetNumJoystickAxes()` `GetNumJoystickBalls()`, `GetNumJoystickButtons()`, `GetNumJoystickHats()` `GetJoystickAxisState()`, `GetJoystickHatState()`, `GetJoystickButtonState()`

### 11.1.23 GetNumJoysticks()

*Determines how many joysticks are available*

**Description:**

This gets the number of joysticks available on a system. It returns an integer, which if greater than you can open a joystick using the `OpenJoystick()` function..

**See Also:**

`GetNumJoysticks()`, `OpenJoystick()`, `GetNumJoystickAxes()` `GetNumJoystickBalls()`, `GetNumJoystickButtons()`, `GetNumJoystickHats()` `GetJoystickAxisState()`, `GetJoystickHatState()`, `GetJoystickButtonState()`

### 11.1.24 GetPEBLVersion()

*Returns a string indicating which version of PEBL you are using*

**Description:**

Returns a string describing which version of PEBL you are running.

**Usage:**

```
GetPEBLVersion()
```

**Example:**

```
Print(GetPEBLVersion())
```

**See Also:**

`TimeStamp()`

### 11.1.25 GetSystemType()

*Identifies the type of operating system being used.*

**Description:**

Returns a string identify what type of computer system you are using. It will return either: OSX, LINUX, or WINDOWS.

**Usage:**

```
GetSystemType()
```

**Example:**

```
## Put this at the beginning of an experiment,  
## after a window gWin has been defined.  
if(GetSystemType() == "WINDOWS")  
{  
    SignalFatalError("Experiment untested on windows")  
}
```

**See Also:**

SystemCall()

### 11.1.26 GetTextBoxCursorFromClick()

**Description:**

Returns the position (in characters) corresponding to a x,y click on a text box. The X,Y position must be relative to the x,y position of the box, not absolute. Once obtained, the cursor position can be set with SetCursorPosition().

**Usage:**

```
GetTextBoxCursorFromClick(<widget>,<x>,<y>)
```

**See Also:**

SetCursorPosition(),      GetCursorPosition(),      SetEditable(),  
MakeTextBox()

### 11.1.27 GetTime()

*Gets a number, in milliseconds, representing the time since the PEBL program began running.*

**Description:**

Gets time, in milliseconds, from when PEBL was initialized. Do not use as a seed for the RNG, because it will tend to be about the same on each run. Instead, use `RandomizeTimer()`.

**Usage:**

```
GetTime()
```

**Example:**

```
a <- GetTime()
WaitForKeyDown("A")
b <- GetTime()
Print("Response time is: " + (b - a))
```

**See Also:**

`TimeStamp()`

### 11.1.28 GetTimeOfDay()

*Returns the current time in seconds since Unix epoch*

**Description:**

Returns the current time of day in seconds since the Unix epoch (January 1, 1970). This provides an absolute timestamp useful for logging when events occurred in real-world time.

**Usage:**

```
GetTimeOfDay()
```

**Example:**

```
timestamp <- GetTimeOfDay()
Print("Current Unix timestamp: " + timestamp)
```

**See Also:**

`GetTime()`, `TimeStamp()`

### 11.1.29 GetVideoModes()

*Gets list of available screen resolutions*

**Description:**

Gets a list of useable video modes (in width/height pixel pairs), as supplied by the video driver, for a specified screen. Screen is specified as an integer, with 0 being the default screen. If no screen is specified, screen 0 is used.

**Usage:**

```
modes <- GetVideoModes()
```

**Example:**

```
Print(GetVideoModes)
##Might return:
[[1440, 900]
, [1360, 768]
, [1152, 864]
, [1024, 768]
, [960, 600]
, [960, 540]
, [840, 525]
, [832, 624]
, [800, 600]
, [800, 512]
, [720, 450]
, [720, 400]
, [700, 525]
]
```

**See Also:**

GetCurrentScreenResolution(), gVideoWidth(), gVideoHeight(),  
GetDrivers()

### 11.1.30 GetWorkingDirectory()

*Returns the current working directory*

**Description:**

Returns the current working directory path. This is the directory from which PEBL is currently executing and where relative file paths are resolved.

**Usage:**

```
GetWorkingDirectory()
```

**Example:**

```
cwd <- GetWorkingDirectory()
Print("Current directory: " + cwd)
```

**See Also:**

SetWorkingDirectory(), GetHomeDirectory(), GetDirectoryListing()

### 11.1.31 IsAnyKeyDown()

*Determines whether any key is down.*

**Description:**

```
IsAnyKeyDown()
```

**Usage:**

```
IsAnyKeyDown()
```

### 11.1.32 IsAudioOut()

**Description:**

Tests whether <variant> is a AudioOut stream.

**Usage:**

```
IsAudioOut(<variant>)
```

**Example:**

```
if(IsAudioOut(x))
{
  Play(x)
}
```

**See Also:**

IsColor(), IsImage(), IsInteger(), IsFileStream(), IsFloat(), IsFont(),  
IsLabel(), IsList(), IsNumber(), IsString(), IsTextBox(), IsWidget()

### 11.1.33 IsCanvas()

**Description:**

Tests whether <variant> is a Canvas widget.

**Usage:**

```
IsCanvas(<variant>)
```

**Example:**

```
if(IsCanvas(x)
{
    SetPixel(x,10,10,MakeColor("red"))
}
```

**See Also:**

IsAudioOut(), IsImage(), IsInteger(), IsFileStream(), IsFloat(),  
IsFont(), IsLabel(), IsList(), IsNumber(), IsString(), IsTextBox(),  
IsText() IsWidget(), IsWindow()

### 11.1.34 IsColor()

**Description:**

Tests whether <variant> is a Color.

**Usage:**

```
IsColor(<variant>)
```

**Example:**

```
if(IsColor(x)
{
    gWin <- MakeWindow(x)
}
```

**See Also:**

IsAudioOut(), IsImage(), IsInteger(), IsFileStream(), IsFloat(),  
IsFont(), IsLabel(), IsList(), IsNumber(), IsString(), IsTextBox(),  
IsWidget(), IsWindow()

### 11.1.35 IsCustomObject()

*Tests whether object is a custom object.*

**Description:**

Tests whether <variant> is a Custom object (created with `MakeCustomObject()`).  
Return 1 if so, 0 if not.

**Usage:**

```
IsCustomObject(<obj>)
```

**Example:**

```
if(IsCustomObject(obj))
{
    MoveObject(obj,x,y)
} else {
    Move(obj,x,y)
}
```

**See Also:**

`IsAudioOut()`, `IsImage()`, `IsInteger()`, `IsFileStream()`, `IsFloat()`,  
`IsFont()`, `IsLabel()`, `IsList()`, `IsNumber()`, `IsString()`, `IsTextBox()`,  
`IsText()` `IsWidget()`, `IsWindow()`

### 11.1.36 IsDirectory()

*Checks whether a file is a directory*

**Description:**

Determines whether a named path is a directory. Returns 1 if it exists and is a directory, and 0 otherwise.

**Usage:**

```
IsDirectory(<path>)
```

**Example:**

```
filename <- "data-"+gSubNum+".csv"
exists <- FileExists(filename)
if(exists)
{
    out <- IsDirectory(filename)
```

(continues on next page)

(continued from previous page)

```
Print(out)
}
```

**See Also:**

GetDirectoryListing(), FileExists(), IsDirectory(), MakeDirectory()

### 11.1.37 IsFileStream()

**Description:**

Tests whether <variant> is a FileStream object.

**Usage:**

```
IsFileStream(<variant>)
```

**Example:**

```
if(IsFileStream(x))
{
    Print(FileReadWord(x))
}
```

**See Also:**

IsAudioOut(), IsColor(), IsImage(), IsInteger(), IsFloat(), IsFont(),  
IsLabel(), IsList(), IsNumber(), IsString(), IsTextBox(), IsWidget()

### 11.1.38 IsFloat()

**Description:**

Tests whether <variant> is a floating-point value. Note that floating-point can represent integers with great precision, so that a number appearing as an integer can still be a float.

**Usage:**

```
IsFloat(<variant>)
```

**Example:**

```
x <- 44
y <- 23.5
```

(continues on next page)

(continued from previous page)

```
z <- 6.5
test <- x + y + z

IsFloat(x)      # false
IsFloat(y)      # true
IsFloat(z)      # true
IsFloat(test)   # true
```

**See Also:**

IsAudioOut(), IsColor(), IsImage(), IsInteger(), IsFileStream(),  
IsFont(), IsLabel(), IsList(), IsNumber(), IsString(), IsTextBox(),  
IsWidget()

### 11.1.39 IsFont()

**Description:**

Tests whether <variant> is a Font object.

**Usage:**

```
IsFont(<variant>)
```

**Example:**

```
if(IsFont(x))
{
  y <- MakeLabel("stimulus", x)
}
```

**See Also:**

IsAudioOut(), IsColor(), IsImage(), IsInteger(), IsFileStream(),  
IsFloat(), IsLabel(), IsList(), IsNumber(), IsString(), IsTextBox(),  
IsWidget()

### 11.1.40 IsImage()

**Description:**

Tests whether <variant> is an Image.

**Usage:**

```
IsImage(<variant>)
```

**Example:**

```
if(IsImage(x))
{
  AddObject(gWin, x)
}
```

**See Also:**

IsAudioOut(), IsColor(), IsInteger(), IsFileStream(), IsFloat(), IsFont(), IsLabel(), IsList(), IsNumber(), IsString(), IsTextBox(), IsWidget()

**11.1.41 IsInteger()****Description:**

Tests whether <variant> is an integer type. Note: a number represented internally as a floating-point type whose is an integer will return false. Floating-point numbers can be converted to internally- represented integers with the ToInteger() or Round() commands.

**Usage:**

```
IsInteger(<variant>)
```

**Example:**

```
x <- 44
y <- 23.5
z <- 6.5
test <- x + y + z

IsInteger(x)      # true
IsInteger(y)      # false
IsInteger(z)      # false
IsInteger(test)   # false
```

**See Also:**

IsAudioOut(), IsColor(), IsImage(), IsFileStream(), IsFloat(), IsFont(), IsLabel(), IsList(), IsNumber(), IsString(), IsTextBox(), IsWidget()

#### 11.1.42 IsKeyDown()

**Description:**

**See Also:**

IsKeyUp()

#### 11.1.43 IsKeyUp()

**Description:**

**See Also:**

IsKeyDown()

#### 11.1.44 IsLabel()

**Description:**

Tests whether <variant> is a text Label object.

**Usage:**

```
IsLabel(<variant>)
```

**Example:**

```
if(IsLabel(x))
{
  text <- GetText(x)
}
```

**See Also:**

IsAudioOut(), IsColor(), IsImage(), IsInteger(), IsFileStream(),  
IsFloat(), IsFont(), IsList(), IsNumber(), IsString(), IsTextBox(),  
IsWidget()

### 11.1.45 IsList()

**Description:**

Tests whether <variant> is a PEBL list.

**Usage:**

```
IsList(<variant>)
```

**Example:**

```
if(IsList(x))
{
    loop(item, x)
    {
        Print(item)
    }
}
```

**See Also:**

IsAudioOut(), IsColor(), IsImage(), IsInteger(), IsFileStream(),  
IsFloat(), IsFont(), IsLabel(), IsNumber(), IsString(), IsTextBox(),  
IsWidget()

### 11.1.46 IsNumber()

**Description:**

Tests whether <variant> is a number, either a floating-point or an integer.

**Usage:**

```
IsNumber(<variant>)
```

**Example:**

```
if(IsNumber(x))
{
    Print(Sequence(x, x+10, 1))
}
```

**See Also:**

IsAudioOut(), IsColor(), IsImage(), IsInteger(), IsFileStream(),  
IsFloat(), IsFont(), IsLabel(), IsList(), IsString(), IsTextBox(),  
IsWidget()

### 11.1.47 IsShape()

**Description:**

Tests whether <variant> is a drawable shape, such as a circle, square rectangle, line, bezier curve, or polygon.

**Usage:**

```
IsShape(<variant>)
```

**Example:**

```
if(IsShape(x))
{
    Move(x,300,300)
}
```

**See Also:**

Square(), Circle(), Rectangle(), Line(), Bezier(), Polygon()  
IsAudioOut(), IsColor(), IsImage(), IsInteger(), IsFileStream(),  
IsFloat(), IsFont(), IsLabel(), IsList(), IsNumber(), IsString(),  
IsTextBox(), IsWindow()

### 11.1.48 IsString()

**Description:**

Tests whether <variant> is a text string.

**Usage:**

```
IsString(<variant>)
```

**Example:**

```
if(IsString(x))
{
    tb <- MakeTextBox(x, 100, 100)
}
```

**See Also:**

IsText() IsAudioOut(), IsColor(), IsImage(), IsInteger(),  
IsFileStream(), IsFloat(), IsFont(), IsLabel(), IsList(), IsNumber(),  
IsTextBox(), IsWidget()

### 11.1.49 IsText()

**Description:**

Tests whether <variant> is a text string. Same as IsString().

**Usage:**

```
IsString(<variant>)
```

**Example:**

```
if(IsText(x))
{
    tb <- MakeTextBox(x, 100, 100)
}
```

**See Also:**

IsString()    IsAudioOut(),    IsColor(),    IsImage(),    IsInteger(),  
IsFileStream(), IsFloat(), IsFont(), IsLabel(), IsList(), IsNumber(),  
IsTextBox(), IsWidget()

### 11.1.50 IsTextBox()

**Description:**

Tests whether <variant> is a TextBox Object

**Usage:**

```
IsTextBox(<variant>)
```

**Example:**

```
if(IsTextBox(x))
{
    Print(GetText(x))
}
```

**See Also:**

IsAudioOut(), IsColor(), IsImage(), IsInteger(), IsFileStream(),  
IsFloat(), IsFont(), IsLabel(), IsList(), IsNumber(), IsString(),  
IsWidget()

### 11.1.51 IsWidget()

**Description:**

Tests whether <variant> is any kind of a widget object (image, label, or textbox).

**Usage:**

```
IsWidget(<variant>)
```

**Example:**

```
if(IsWidget(x))
{
    Move(x, 200,300)
}
```

**See Also:**

IsAudioOut(), IsColor(), IsImage(), IsInteger(), IsFileStream(), IsFloat(), IsFont(), IsLabel(), IsList(), IsNumber(), IsString(), IsTextBox()

### 11.1.52 IsWindow()

**Description:**

Tests whether <variant> is a window.

**Usage:**

```
IsWindow(<variant>)
```

**Example:**

```
if(IsWindow(x))
{
    AddObject(y,x)
}
```

**See Also:**

IsAudioOut(), IsColor(), IsImage(), IsInteger(), IsFileStream(), IsFloat(), IsFont(), IsLabel(), IsList(), IsNumber(), IsString(), IsTextBox()

### 11.1.53 LaunchFile()

*Launches a file using platform-specific handlers*

**Description:**

Launch a specified file or URI with a platform-specific handler.

**Usage:**

```
LaunchFile("filename")
```

**See Also:**

SystemCall()

### 11.1.54 MakeDirectory()

*Creates a directory in path*

**Description:**

Creates a directory with a particular name. It will have no effect if the directory already exists.

**Usage:**

```
FileExists(<path>)
```

**Example:**

```
#create data subdirectory + subject-specific directory
MakeDirectory("data")
MakeDirectory("data/"+gsubnum)
filename <- "data/"+gsubnum+"/output.csv"
```

**See Also:**

GetDirectoryListing(), FileExists(), IsDirectory(), MakeDirectory()

### 11.1.55 OpenJoystick()

*Gets a joystick object*

**Description:**

This opens an available joystick, as specified by its index. The returned object can then be used in to access the state of the joystick. It takes an integer argument, and for the most part, if you have a single joystick attached to your

system, you will use `OpenJoystick(1)`. If you want to use a second joystick, use `OpenJoystick(2)`, and so on.

**See Also:**

`GetNumJoysticks()`, `OpenJoystick()`, `GetNumJoystickAxes()` `GetNumJoystickBalls()`, `GetNumJoystickButtons()`, `GetNumJoystickHats()` `GetJoystickAxisState()`, `GetJoystickHatState()`, `GetJoystickButtonState()`

### 11.1.56 `PlayMovie()`

**\*(CURRENTLY NOT WORKING)\*** *Plays a movie until its end*

**Description:**

Plays the movie (or other multimedia file) loaded via either the `LoadMovie` or `LoadAudioFile` function. Note that this functionality uses a different underlying system than the sound playing functions `PlayBackground` and `PlayForeground`, and they are not interchangeable.

**Usage:**

```
PlayMovie(movie)
```

**Example:**

```
movie <- LoadMovie("movie.avi",gWin,640,480)
PrintProperties(movie)
Move(movie,20,20)
movie.volume <- .1
status <- EasyLabel("Demo Movie Player",300,25,gWin,22)
Draw()
PlayMovie(movie)
```

**See Also:**

`LoadAudioFile()`, `LoadMovie()`, `StartPlayback()`, `PausePlayback()`

### 11.1.57 `RegisterEvent()`

*Registers events to trigger based on particular conditions*

**Description:**

Adds an event to the event loop. This function is currently experimental, and its usage may change in future versions of PEBL.

**Usage:**

```
## shows a way to generate custom WaitForMouseButton
RegisterEvent("<MOUSE_BUTTON_PRESS>",1,1,"<EQUAL>", "", [])
out <- StartEventLoop()
ClearEventLoop()
```

**See Also:**

ClearEventLoop(), StartEventLoop()

### 11.1.58 SetMouseCursorPosition()

**Description:**

Sets the current x,y coordinates of the mouse pointer, ‘warping’ the mouse to that location immediately

**Usage:**

```
SetMouseCursorPosition(<x>,<y>)
```

**Example:**

```
##Set mouse to center of screen:
SetMouseCursorPosition(gVideoWidth/2,
                       gVideoHeight/2)
```

**See Also:**

ShowCursor(), WaitForMouseButton(), SetMouseCursorPosition(),  
GetMouseCursorPosition()

### 11.1.59 SetWorkingDirectory()

*Changes the current working directory*

**Description:**

Changes the current working directory to the specified path. This affects how relative file paths are resolved in subsequent file operations.

**Usage:**

```
SetWorkingDirectory(<path>)
```

**Example:**

```
SetWorkingDirectory("./data")
Print(GetWorkingDirectory()) ##Shows new directory

##Now relative paths work from ./data
file <- FileOpenRead("output.csv")
```

**See Also:**

GetWorkingDirectory(), GetHomeDirectory(), FileExists()

### 11.1.60 ShowCursor()

*Hides or show mouse cursor.*

**Description:**

Hides or shows the mouse cursor. Currently, the mouse is not used, but on some systems in some configurations, the mouse cursor shows up. Calling ShowCursor(0) will turn off the cursor, and ShowCursor(1) will turn it back on. Be sure to turn it on at the end of the experiment, or you may actually lose the cursor for good.

**Usage:**

```
ShowCursor(<value>)
```

**Example:**

```
window <- MakeWindow()
ShowCursor(0)
## Do experiment here
##

## Turn mouse back on.
ShowCursor(1)
```

### 11.1.61 SignalFatalError()

*Halts execution, printing out message*

**Description:**

Stops PEBL and prints <message> to stderr. In addition, when possible, it will pop-up a window with the error message. Useful for type-checking in user-defined functions. If you want to end an experiment directly, use ExitQuietly instead.

**Usage:**

```
SignalFatalError(<message>)
```

**Example:**

```
If(not IsList(x))
{
  SignalFatalError("Tried to frobnicate a List.")
}
##Prints out error message and
##line/filename of function
```

**See Also:**

Print(), ExitQuietly()

### 11.1.62 StartEventLoop()

*Starts the event loop*

**Description:**

Starts the event loop with currently-registered events. This function is currently experimental, and its usage may change in future versions of PEBL.

**Usage:**

```
## shows a way to generate custom WaitForMouseButton
RegisterEvent("<MOUSE_BUTTON_PRESS>",1,1,"<EQUAL>", "", [])
out <- StartEventLoop()
ClearEventLoop()
```

**See Also:**

RegisterEvent(), ClearEventLoop()

### 11.1.63 SystemCall()

*Executes command in operating system*

**Description:**

Calls/runs another operating system command. Can also be used to launch another PEBL program. Useful to check GetSystemType() before running. Note that the output of a command-line argument is generally not passed back into PEBL; just the function's return code, which is usually 0 on success or

some other number on failure (depending upon the type of failure). Some uses might include:

**Usage:**

```
SystemCall("text-of-command")
SystemCall("text-of-command", "command-line-options")
```

**Example:**

```
if(GetSystemType() == "WINDOWS")
{
  x <- SystemCall("dir input.txt")
} else {
  x <- SystemCall("ls input.txt")
}
if(x <> 0)
{
  SignalFatalError("Expected file ["+
    "input.txt] does not exist")
}
```

**See Also:**

GetSystemType()

### 11.1.64 SystemCallUpdate()

*Executes an OS command with real-time output updates*

**Description:**

Calls an operating system command similar to SystemCall(), but with support for receiving output updates during execution. This is useful for long-running commands where you want to see progress.

**Usage:**

```
SystemCallUpdate(<command>)
SystemCallUpdate(<command>, <arguments>)
```

**Example:**

```
##Run a command with arguments
result <- SystemCallUpdate("ls", "-la")
```

**See Also:**

SystemCall(), GetSystemType()

### 11.1.65 TimeStamp()

*Returns a string containing the current date and time*

**Description:**

Returns a string containing the date-and-time, formatted according to local conventions. Should be used for documenting the time-of-day and date an experiment was run, but not for keeping track of timing accuracy. For that, use `GetTime()`.

**Usage:**

```
TimeStamp()
```

**Example:**

```
a <- TimeStamp()  
Print(a)
```

**See Also:**

`GetTime()`

### 11.1.66 TranslateKeyCode()

*Converts a keycode to a key name*

**Description:**

Translates a code corresponding to a keyboard key into a keyboard value. This code is returned by some event/device polling functions.

### 11.1.67 TranslateString()

*Converts a key name string to its keycode*

**Description:**

Translates a string representation of a key (like “a”, “space”, “return”) into its corresponding internal keycode value. This is useful for programmatically working with keyboard input.

**Usage:**

```
TranslateString(<key_string>)
```

**Example:**

```
keycode <- TranslateString("a")
spaceCode <- TranslateString("space")
enterCode <- TranslateString("return")
```

**See Also:**

`TranslateKeyCode()`, `WaitForKeyPress()`

### 11.1.68 VariableExists()

**Description:**

Tests whether a variable exists.

**Usage:**

```
Uppercase("variablename")
```

**Example:**

```
if(not VariableExists("underwear"))
{
    underwear <- "Under there"
}
```

**See Also:**

`PropertyExists()`

### 11.1.69 Wait()

**Description:**

Waits the specified number of milliseconds, then returns.

**Usage:**

```
Wait(<time>)
```

**Example:**

```
Wait(100)
Wait(15)
```

### 11.1.70 WaitForAllKeysUp()

*Waits until all keys are in up state*

**Description:**

Wait until all keyboard keys are in the up position. This includes numlock, capslock, etc.

### 11.1.71 WaitForKeyDown()

*Waits until a specific key is in the down state*

**Description:**

Waits for a specific key to be detected in the down position. Unlike WaitForKeyPress(), this tests the state of the key rather than waiting for a keypress event. Will return immediately if the key is already down when called.

**Usage:**

```
WaitForKeyDown(<key>)
```

**Example:**

```
WaitForKeyDown("a")
Print("The 'a' key is now down")
```

**See Also:**

WaitForKeyPress(), WaitForKeyRelease(), WaitForAnyKeyDown()

### 11.1.72 WaitForAnyKeyDown()

*Waits until any key is detected in down state*

**Description:**

Waits for any key to be detected in the down position. This includes numlock, capslock, etc, which can be locked in the down position even if they are not being held down. Will return immediately if a key is being held down before the function is called.

**See Also:**

WaitForAnyKeyPress()

### 11.1.73 WaitForAnyKeyDownWithTimeout()

**Description:**

Waits until any key is detected in the down position, but will return after a specified number of milliseconds. This tests for the key position on each cycle; users should prefer using WaitForAnyKeyPressWithTimeout() which waits for the keypress event.

**Usage:**

```
WaitForAnyKeyDownWithTimeout(<time>)
```

**See Also:**

WaitForAnyKeyPressWithTimeout(), WaitListKeyPressWithTimeout(),  
WaitForAnyKeyPress(), WaitListKeyPress()

### 11.1.74 WaitForAnyKeyPress()

*Waits until any key is pressed*

**Description:**

Waits until any key is pressed, and returns the key pressed. This waits for the keyboard event, which is typically more reliable and less computationally taxing than waiting for the keyboard state (which updates based on those events anyway).

**Usage:**

```
WaitForKeyPress(<time>)
```

**Example:**

```
cont <- 1
while(cont)
{
  key <- WaitForAnyKeyPress()
  if(key == "x")
  {
    cont <- 0
  }
}
```

**See Also:**

WaitForAnyKeyPressWithTimeout(), WaitListKeyPressWithTimeout(),  
WaitListKeyPress()

### 11.1.75 WaitForAnyKeyPressWithTimeout()

**Description:**

Waits until any key is detected in the down position, but will return after a specified number of milliseconds. This tests for the key position on each cycle; users should prefer using `WaitForAnyKeyPressWithTimeout()` which waits for the keypress event.

**Usage:**

```
WaitForAnyKeyDownWithTimeout(<time>)
```

**See Also:**

`WaitForAnyKeyPressWithTimeout()`, `WaitListKeyPressWithTimeout()`

### 11.1.76 WaitForKeyListDown()

*Waits until one of the keys is in down state*

**Description:**

Returns when any one of the keys specified in the argument is down. If a key is down when called, it will return immediately.

**Usage:**

```
WaitForKeyListDown(<list-of-keys>)
```

**Example:**

```
WaitForKeyListDown(["a","z"])
```

### 11.1.77 WaitForKeyPress()

**Description:**

Waits for a keypress event that matches the specified key. Usage of this function is preferred over `WaitForKeyDown()`, which tests the state of the key. Returns the value of the key pressed.

**Usage:**

```
WaitForKeyPress(<key>)
```

**See Also:**

`WaitForAnyKeyPress()`, `WaitForKeyRelease()`, `WaitForListKeyPress()`

### 11.1.78 WaitForKeyUp()

**Description:**

### 11.1.79 WaitForKeyRelease()

*Waits until a specific key is released*

**Description:**

Waits for a specific key to be released (transition from down to up state). This is useful for ensuring a key has been released before continuing, preventing accidental repeated inputs.

**Usage:**

```
WaitForKeyRelease(<key>)
```

**Example:**

```
WaitForKeyPress("space")
Print("Space pressed")
WaitForKeyRelease("space")
Print("Space released")
```

**See Also:**

WaitForKeyDown(), WaitForKeyPress(), WaitForAnyKeyPress()

### 11.1.80 WaitForListKeyPress()

**Description:**

Returns when any one of the keys specified in the argument is pressed. Will only return on a new keyboard event, and so a previously pressed key will not trip this function, unlike WaitForKeyListDown() Returns a string indicating the value of the keypress.

**Usage:**

```
WaitForListKeyPress(<list-of-keys>)
```

**Example:**

```
WaitForListKeyPress(["a","z"])
```

**See Also:**

`WaitForKeyListDown()`, `WaitForListKeyPressWithTimeout()`

### 11.1.81 WaitForListKeyPressWithTimeout()

**Description:**

Returns when any one of the keys specified in the argument is pressed, or when the timeout has elapsed; whichever comes first. Will only return on a new keyboard/timeout events, and so a previously pressed key will not trip this function, unlike `WaitForKeyListDown()`. The optional `<style>` parameter is currently unused, but may be deployed in the future for differences in how or when things should be returned. Returns the value of the pressed key. If the function terminates by exceeding the `<timeout>`, it will return the string `"<timeout>"`. Note: previous to 2.0, returned a list [`"<timeout>"`], which may mean updating logic for tests designed in the 0.x series.

**Usage:**

```
WaitForListKeyPressWithTimeout(<list-of-keys>,  
                               <timeout>,opt:<style>)
```

**Example:**

```
x <- WaitForListKeyPressWithTimeout(["a","z"],  
                                   2000)  
  
if(IsList(x))  
{  
  Print("Did Not Respond.")  
}
```

**See Also:**

`WaitForKeyListDown()`, `WaitForListKeyPress()`,  
`WaitForKeyPressWithTimeout()`

### 11.1.82 WaitForMouseButton()

*Waits until any of the mouse buttons is pressed or released, and returns message indicating what happened*

**Description:**

Waits for a mouse click event to occur. This takes no arguments, and returns a 4-tuple list, indicating:

```
[xpos, ypos, button id [1-3], "<pressed>" or "<released>"]
```

Usage:

```
WaitForMouseButton()
```

Example:

```
## Here is how to wait for a mouse down-click

continue <- 1
while(continue)
{
  x <- WaitForMouseButton()
  if(Nth(x,4)=="<pressed>")
  {
    continue <- 0
  }
}
Print("Clicked")
```

See Also:

```
ShowCursor(), WaitForMouseButtonWithTimeout()
SetMouseCursorPosition(), GetMouseCursorPosition()
```

### 11.1.83 WaitForMouseButtonWithTimeout()

Description:

Waits for a mouse click event to occur, or a timeout to be reached. This takes a single argument: timeout delay in ms. When clicked, it returns a 4-tuple list, indicating:

```
[xpos, ypos, button id [1-3], "<pressed>" or "<released>"]
```

```
when not click and timeout is reached, it returns a list:  ␣
↪ ``[timeout]``
```

Usage:

```
WaitForMouseButtonWithTimeOut(10)
```

Example:

```
## Here is how to wait for a mouse down-click

continue <- 1
while(continue)
{
  x <- WaitForMouseButtonWithTimeout(500)
  if(First(x)=="<timeout>")
  {
    Print("time is "+GetTime())
    continue <- 1
  } else {
    continue <- 0
  }
}
Print("Clicked")
```

See Also:

ShowCursor(), SetMouseCursorPosition(), GetMouseCursorPosition()

## 11.2 PEBLList - List Manipulation

This module contains functions for creating, manipulating, and querying lists.

### Function Index

- *Append()*
- *CrossFactorWithoutDuplicates()*
- *DesignFullCounterbalance()*
- *First()*
- *IsMember()*
- *Last()*
- *Length()*
- *List()*
- *ListToString()*
- *Merge()*
- *ModList()*

- *Nth()*
- *Second()*
- *Third()*
- *Fourth()*
- *Fifth()*
- *PushOnEnd()*
- *Repeat()*
- *RepeatList()*
- *Rotate()*
- *Sequence()*
- *SetElement()*
- *Shuffle()*
- *Sort()*
- *SortBy()*
- *SubList()*
- *Transpose()*

### 11.2.1 Append()

**Description:**

Appends an item to a list. Useful for constructing lists in conjunction with the loop statement. Note: `Append()` is useful, but inefficient for large data structures, because it requires making a copy of the entire data list and then overwriting it, if you use `list <- Append(list, item)`. The overhead will be hardly noticeable unless you are building lists hundreds of elements long. In that case you should either create the list upfront and use `SetElement`, or you use `PushOnEnd` to modify the list directly.

**Usage:**

```
Append(<list>, <item>)
```

**Example:**

```
list <- Sequence(1,5,1)
double <- []
```

(continues on next page)

(continued from previous page)

```

loop(i, list)
{
  double <- Append(double, [i,i])
}
Print(double)
# Produces [[1,1],[2,2],[3,3],[4,4],[5,5]]

```

**See Also:**

SetElement() List(), [ ](), Merge(), PushOnEnd()

### 11.2.2 CrossFactorWithoutDuplicates()

**Description:**

This function takes a single list, and returns a list of all pairs, excluding the pairs that have two of the same item. To achieve the same effect but include the duplicates, use: `DesignFullCounterBalance(x,x)`.

**Usage:**

```
CrossFactorWithoutDuplicates(<list>)
```

**Example:**

```

CrossFactorWithoutDuplicates([a,b,c])
# == [[a,b],[a,c],[b,a],[b,c],[c,a],[c,b]]

```

**See Also:**

DesignFullCounterBalance(), Repeat(), DesignBalancedSampling(),  
DesignGrecoLatinSquare(), DesignLatinSquare(), RepeatList(),  
LatinSquare(), Shuffle()

### 11.2.3 DesignFullCounterbalance()

**Description:**

This takes two lists as parameters, and returns a nested list of lists that includes the full counterbalancing of both parameter lists. Use cautiously; this gets very large.

**Usage:**

```
DesignFullCounterbalance(<lista>, <listb>)
```

**Example:**

```
a <- [1,2,3]
b <- [9,8,7]
DesignFullCounterbalance(a,b)      # == [[1,9],[1,8],[1,7],
#      [2,9],[2,8],[2,7],
#      [3,9],[3,8],[3,7]]
```

**See Also:**

CrossFactorWithoutDuplicates(), LatinSquare(), Shuffle(),  
DesignBalancedSampling(), DesignGrecoLatinSquare(),  
DesignLatinSquare(), Repeat(), RepeatList(),

### 11.2.4 First()

*Returns the first item in a list.*

**Description:**

Returns the first item of a list.

**Usage:**

```
First(<list>)
```

**Example:**

```
First([3,33,132])      # == 3
```

**See Also:**

Nth(), Last()

### 11.2.5 IsMember()

**Description:**

Returns true if <element> is a member of <list>.

**Usage:**

```
IsMember(<element>,<list>)
```

**Example:**

```
IsMember(2,[1,4,6,7,7,7,7])      # false
IsMember(2,[1,4,6,7,2,7,7,7])      # true
```

### 11.2.6 Last()

*Returns the last item in a list.*

**Description:**

Returns the last item in a list. Provides faster access to the last item of a list than does Nth().

**Usage:**

```
Last(<list>)
```

**Example:**

```
Last([1,2,3,444])    # == 444
```

**See Also:**

Nth(), First()

### 11.2.7 Length()

*Returns the number of elements in a list.*

**Description:**

Returns the number of items in a list.

**Usage:**

```
Length(<list>)
```

**Example:**

```
Length([1,3,55,1515])    # == 4
```

**See Also:**

StringLength()

### 11.2.8 List()

*Makes a list out of items*

**Description:**

Creates a list of items. Functional version of [].

**Usage:**

```
List(<item1>, <item2>, ....)
```

**Example:**

```
List(1,2,3,444)           # == [1,2,3,444]
```

**See Also:**

[ ](), Merge(), Append()

### 11.2.9 ListToString()

**Description:**

Converts a list of things to a single string

**Usage:**

```
ListToString(<list>)
```

**Example:**

```
ListToString([1,2,3,444])           # == "123444"  
ListToString(["a","b","c","d","e"]) # == "abcde"
```

**See Also:**

SubString(), StringLength(), ConcatenateList

### 11.2.10 Merge()

*Combines two lists.*

**Description:**

Combines two lists, <lista> and <listb>, into a single list.

**Usage:**

```
Merge(<lista>,<listb>)
```

**Example:**

```
Merge([1,2,3],[8,9])      # == [1,2,3,8,9]
```

**See Also:**

[ ](), Append(), List()

### 11.2.11 ModList()

*Adds pre- and post- elements to each list member*

**Description:**

Modifies each element of a list with a pre- and post- string. If the list item is not a string, it will use whatever string it turns into. This creates a new list, so it could be used to make a copy of a string-based list.

**Usage:**

```
ModList(<list>,<pre>,<post>)
      ModList(list,"<",">")  ##encloses each list item in brackets
```

**Example:**

```
ModList([1,2,3,444]," ","")
      ModList(["a","b","c","d","e"],"","-")
```

**See Also:**

SubString(), StringLength(), FoldList, ConcatenateList,

### 11.2.12 Nth()

*Returns the nth item in a list.*

**Description:**

Extracts the Nth item from a list. Indexes from 1 upwards. Last() provides faster access than Nth() to the end of a list, which must walk along the list to the desired position.

**Usage:**

```
Nth(<list>,<index>)
```

**Example:**

```
a <- ["a", "b", "c", "d"]  
Print(Nth(a,3))           # == 'c'
```

**See Also:**

First(), Last(), Second(), Third(), Fourth(), Fifth()

### 11.2.13 Second()

*Returns the second item in a list.*

**Description:**

Returns the second item of a list. Provides convenient access to the second element without using Nth().

**Usage:**

```
Second(<list>)
```

**Example:**

```
Second([3,33,132,200])    # == 33
```

**See Also:**

First(), Third(), Fourth(), Fifth(), Nth(), Last()

### 11.2.14 Third()

*Returns the third item in a list.*

**Description:**

Returns the third item of a list. Provides convenient access to the third element without using Nth().

**Usage:**

```
Third(<list>)
```

**Example:**

```
Third([3,33,132,200])     # == 132
```

**See Also:**

First(), Second(), Fourth(), Fifth(), Nth(), Last()

### 11.2.15 Fourth()

*Returns the fourth item in a list.*

**Description:**

Returns the fourth item of a list. Provides convenient access to the fourth element without using Nth().

**Usage:**

```
Fourth(<list>)
```

**Example:**

```
Fourth([3,33,132,200])           # == 200
```

**See Also:**

First(), Second(), Third(), Fifth(), Nth(), Last()

### 11.2.16 Fifth()

*Returns the fifth item in a list.*

**Description:**

Returns the fifth item of a list. Provides convenient access to the fifth element without using Nth().

**Usage:**

```
Fifth(<list>)
```

**Example:**

```
Fifth([3,33,132,200,999])       # == 999
```

**See Also:**

First(), Second(), Third(), Fourth(), Nth(), Last()

### 11.2.17 PushOnEnd()

#### Description:

Pushes an item onto the end of a list, modifying the list itself. Note: `PushOnEnd` is a more efficient replacement for `Append()`. Unlike `Append`, it will modify the original list as a side effect, so the following works:

```
PushOnEnd(list, item)
```

There is no need to set the original list to the result of `PushOnEnd`, like you must do with `Append`. However, it does in fact work, and incurs only a slight overhead, so that `Append` can often be replaced with `PushOnEnd` without worry.

```
list <- PushOnEnd(list, item)
```

#### Usage:

```
PushOnEnd(<list>, <item>)
```

#### Example:

```
list <- Sequence(1,5,1)
double <- []
loop(i, list)
{
  PushOnEnd(double, [i,i])
}
Print(double)
# Produces [[1,1],[2,2],[3,3],[4,4],[5,5]]
```

#### See Also:

`SetElement()` `List()`, `[ ]()`, `Merge()`, `PushOnEnd()`

### 11.2.18 Repeat()

#### Description:

Makes and returns a list by repeating `<object>` `<n>` times. Has no effect on the object. `Repeat` will not make new copies of the object. If you later change the object, you will change every object in the list.

#### Usage:

```
Repeat(<object>, <n>)
```

**Example:**

```
x <- "potato"
y <- repeat(x, 10)
Print(y)
# produces ["potato","potato","potato",
            "potato","potato", "potato",
            "potato","potato","potato","potato"]
```

**See Also:**

RepeatList()

### 11.2.19 RepeatList()

**Description:**

Makes a longer list by repeating a shorter list <n> times. Has no effect on the list itself, but changes made to objects in the new list will also affect the old list.

**Usage:**

```
RepeatList(<list>, <n>)
```

**Example:**

```
RepeatList([1,2],3) # == [1,2,1,2,1,2]
```

**See Also:**

Repeat(), Merge(), [ ]()

### 11.2.20 Rotate()

**Description:**

Returns a list created by rotating a list by <n> items. The new list will begin with the <n+1>`th item of the old list (modulo its length), and contain all of its items in order, jumping back to the beginning and ending with the ``<n>`th item. Rotate(``<list>,0) has no effect. Rotate does not modify the original list.

**Usage:**

```
Rotate(<list-of-items>, <n>)
```

**Example:**

```
Rotate([1,11,111],1) # == [11,111,1]
```

**See Also:**

Transpose()

### 11.2.21 Sequence()

**Description:**

Makes a sequence of numbers from <start> to <end> at <step>-sized increments. If <step> is positive, <end> must be larger than <start>, and if <step> is negative, <end> must be smaller than <start>. If <start> + n\*<step> does not exactly equal <end>, the last item in the sequence will be the number closest number to <end> in the direction of <start> (and thus <step>).

**Usage:**

```
Sequence(<start>, <end>, <step>)
```

**Example:**

```
Sequence(0,10,3)    # == [0,3,6,9]
Sequence(0,10,1.5)  # == [0,1.5,3,4.5, 6, 7.5, 9]
Sequence(10,1,3)    # error
Sequence(10,0,-1)   # == [10,9,8,7,6,5,4,3,2,1]
```

**See Also:**

Repeat(), RepeatList()

### 11.2.22 SetElement()

*Sets an element of list to value*

**Description:**

Efficiently alter a specific item from a list. **SetElement** has length-constant access time, and so it can be efficient to pre-create a list structure and then populate it one-by-one.

**Usage:**

```
SetElement(<list>, <index>, <value>)
```

**Example:**

```
##Set a random subset of elements to their index:
list <- Repeat(0,10)
index <- 1
while(index <= 10)
{
  if(Random()<.2)
  {
    SetElement(list,index,index)
  }
  index <- index + 1
}
```

**See Also:**

Nth(), Append(), PushOnEnd()

### 11.2.23 Shuffle()

*Returns a new list with the items in list shuffled randomly.*

**Description:**

Randomly shuffles a list.

**Usage:**

```
Shuffle(list)
```

**Example:**

```
Print(Shuffle([1,2,3,4,5]))
# Results might be anything, like [5,3,2,1,4]
```

**See Also:**

Sort(), SortBy(), ShuffleRepeat(), ShuffleWithoutAdjacents()

### 11.2.24 Sort()

*Sorts a list by its values.*

**Description:**

Sorts a list by its values from smallest to largest.

**Usage:**

```
Sort(<list>)
```

**Example:**

```
Sort([3,4,2,1,5]) # == [1,2,3,4,5]
```

**See Also:**

SortBy(), Shuffle()

### 11.2.25 SortBy()

**Description:**

Sorts a list by the values in another list, in ascending order.

**Usage:**

```
SortBy(<value-list>, <key-list>)
```

**Example:**

```
SortBy(["Bobby","Greg","Peter"], [3,1,2])  
# == ["Greg","Peter","Bobby"]
```

**See Also:**

Shuffle(), Sort()

### 11.2.26 SubList()

*Returns a sublist of a list.*

**Description:**

Extracts a list from another list, by specifying beginning and end points of new sublist.

**Usage:**

```
SubList(<list>, <begin>, <end>)
```

**Example:**

```
SubList([1,2,3,4,5,6],3,5)    # == [3,4,5]
```

**See Also:**

SubSet(), ExtractListItems()

### 11.2.27 Transpose()

*Transposes a list of equal-length lists.*

**Description:**

Transposes or **rotates** a list of lists. Each sublist must be of the same length.

**Usage:**

```
Transpose(<list-of-lists>)
```

**Example:**

```
Transpose([[1,11,111],[2,22,222],  
           [3,33,333],[4,44,444]])  
# == [[1,2,3,4],[11,22,33,44],  
#      [111,222,333,444]]
```

**See Also:**

Rotate()

## 11.3 PEBLMath - Mathematical

This module contains compiled mathematical and statistical functions.

- *ToInteger()*
- *ToNumber()*
- *ToString()*

### 11.3.1 Abs()

*Returns the absolute value of the number*

**Description:**

Returns the absolute value of the number.

**Usage:**

```
Abs(<num>)
```

**Example:**

```
Abs(-300)    # ==300  
Abs(23)      # ==23
```

**See Also:**

Round(), Floor(), AbsFloor(), Sign(), Ceiling()

### 11.3.2 AbsFloor()

**Description:**

Rounds <num> toward 0 to an integer.

**Usage:**

```
AbsFloor(<num>)
```

**Example:**

```
AbsFloor(-332.7)  # == -332  
AbsFloor(32.88)   # == 32
```

**See Also:**

Round(), Floor(), Abs(), Sign(), Ceiling()

### 11.3.3 ACos()

**Description:**

Inverse cosine of <num>, in degrees.

**Usage:**

```
ACos(<num>)
```

**See Also:**

Cos(), Sin(), Tan(), ATan(), ATan()

### 11.3.4 ASin()

**Description:**

Inverse Sine of <num>, in degrees.

**Usage:**

```
ASin(<num>)
```

**See Also:**

Cos(), Sin(), Tan(), ATan(), ACos(), ATan()

### 11.3.5 ATan()

**Description:**

Inverse Tan of <num>, in degrees.

**See Also:**

Cos(), Sin(), Tan(), ATan(), ACos(), ATan()

### 11.3.6 Ceiling()

**Description:**

Rounds <num> up to the next integer.

**Usage:**

```
Ceiling(<num>)
```

**Example:**

```
Ceiling(33.23)      # == 34
Ceiling(-33.02)     # == -33
```

**See Also:**

Round(), Floor(), AbsFloor(), Ceiling()

### 11.3.7 Cos()

**Description:**

Cosine of <deg> degrees.

**Example:**

```
Cos(33.5)
Cos(-32)
```

**See Also:**

Sin(), Tan(), ATan(), ACos(), ATan()

### 11.3.8 DegToRad()

*Converts degrees to radians*

**Description:**

Converts degrees to radians.

**Usage:**

```
DegToRad(<deg>)
```

**Example:**

```
DegToRad(180) # == 3.14159...
```

**See Also:**

Cos(), Sin(), Tan(), ATan(), ACos(), ATan()

### 11.3.9 Div()

**Description:**

Returns `round(<num>/<mod>)`

**Usage:**

```
Div(<num>, <mod>)
```

**See Also:**

`Mod()`

### 11.3.10 Exp()

**Description:**

`$e$` to the power of `<pow>`.

**Usage:**

```
Exp(<pow>)
```

**Example:**

```
Exp(0)           # == 1
Exp(3)           # == 20.0855
```

**See Also:**

`Log()`

### 11.3.11 Floor()

**Description:**

Rounds `<num>` down to the next integer.

**Usage:**

```
Floor(<num>)
```

**Example:**

```
Floor(33.23) # == 33
Floor(3.999)  # == 3
Floor(-32.23) # == -33
```

**See Also:**

`AbsFloor()`, `Round()`, `Ceiling()`

### 11.3.12 `Ln()`

**Description:**

Natural log of `<num>`.

**Usage:**

```
Ln(<num>)
```

**See Also:**

`Log()`, `Log2()`, `LogN()`, `Exp()`

### 11.3.13 `LogN()`

**Description:**

Log base `<base>` of `<num>`.

**Usage:**

```
LogN(<num>, <base>)
```

**Example:**

```
LogN(100,10) # == 2
LogN(256,2)  # == 8
```

**See Also:**

`Log()`, `Log2()`, `Ln()`, `Exp()`

### 11.3.14 `Mod()`

**Description:**

Returns `<num>`, `<mod>`, or remainder of `<num>/<mod>`

**Usage:**

```
Mod( <num> <mod>)
```

**Example:**

```
Mod(34, 10)  # == 4  
Mod(3, 10)   # == 3
```

**See Also:**

Div()

### 11.3.15 NthRoot()

**Description:**

<num> to the power of 1/<root>.

**Usage:**

```
NthRoot(<num>, <root>)
```

### 11.3.16 Pow()

**Description:**

Raises or lowers <num> to the power of <pow>.

**Usage:**

```
Pow(<num>, <pow>)
```

**Example:**

```
Pow(2,6)      # == 64  
Pow(5,0)      # == 1
```

### 11.3.17 RadToDeg()

*Converts radians to degrees*

**Description:**

Converts <rad> radians to degrees.

**Usage:**

```
RadToDeg( <rad>)
```

**See Also:**

DegToRad(), Tan(), Cos(), Sin(), ATan(), ASin(), ACos()

### 11.3.18 Random()

*Returns a random number between 0 and 1*

**Description:**

Returns a random number between 0 and 1.

**Usage:**

```
Random()
```

**Example:**

```
a <- Random()
```

**See Also:**

Random(), RandomBernoulli(), RandomBinomial(), RandomDiscrete(),  
RandomExponential(), RandomLogistic(), RandomLogNormal(),  
RandomNormal(), RandomUniform(), RandomizeTimer(), SeedRNG()

### 11.3.19 RandomBernoulli()

**Description:**

Returns 0 with probability (1-<p>) and 1 with probability <p>.

**Usage:**

```
RandomBernoulli(<p>)
```

**Example:**

```
RandomBernoulli(.3)
```

**See Also:**

Random(), RandomBernoulli(), RandomBinomial(), RandomDiscrete(),  
RandomExponential(), RandomLogistic(), RandomLogNormal(),  
RandomNormal(), RandomUniform(), RandomizeTimer(), SeedRNG()

### 11.3.20 RandomBinomial()

**Description:**

Returns a random number according to the Binomial distribution with probability <p> and repetitions <n>, i.e., the number of <p> Bernoulli trials that succeed out of <n> attempts.

**Usage:**

```
RandomBinomial(<p> <n>)
```

**Example:**

```
RandomBinomial(.3, 10) # returns number from 0 to 10
```

**See Also:**

Random(), RandomBernoulli(), RandomBinomial(), RandomDiscrete(), RandomExponential(), RandomLogistic(), RandomLogNormal(), RandomNormal(), RandomUniform(), RandomizeTimer(), SeedRNG()

### 11.3.21 RandomDiscrete()

**Description:**

Returns a random integer between 1 and the argument (inclusive), each with equal probability. If the argument is a floating-point value, it will be truncated down; if it is less than 1, it will return 1, and possibly a warning message.

**Usage:**

```
RandomDiscrete(<num>)
```

**Example:**

```
# Returns a random integer between 1 and 30:  
RandomDiscrete(30)
```

**See Also:**

Random(), RandomBernoulli(), RandomBinomial(), RandomDiscrete(), RandomExponential(), RandomLogistic(), RandomLogNormal(), RandomNormal(), RandomUniform(), RandomizeTimer(), SeedRNG()

### 11.3.22 RandomExponential()

**Description:**

Returns a random number according to exponential distribution with mean `<mean>` (or decay  $1/\text{mean}$ ).

**Usage:**

```
RandomExponential(<mean>)
```

**Example:**

```
RandomExponential(100)
```

**See Also:**

`Random()`, `RandomBernoulli()`, `RandomBinomial()`, `RandomDiscrete()`,  
`RandomLogistic()`, `RandomLogNormal()`, `RandomNormal()`, `RandomUniform()`,  
`RandomizeTimer()`, `SeedRNG()`

### 11.3.23 RandomizeTimer()

*Seeds the RNG with the current time*

**Description:**

Seeds the RNG with the current time.

**Usage:**

```
RandomizeTimer()
```

**Example:**

```
RandomizeTimer()  
x <- Random()
```

**See Also:**

`Random()`, `RandomBernoulli()`, `RandomBinomial()`, `RandomDiscrete()`,  
`RandomExponential()`, `RandomLogistic()`, `RandomLogNormal()`,  
`RandomNormal()`, `RandomUniform()`, `SeedRNG()`

### 11.3.24 RandomLogistic()

**Description:**

Returns a random number according to the logistic distribution with parameter `<p>`:  $f(x) = \exp(x)/(1+\exp(x))$

**Usage:**

```
RandomLogistic(<p>)
```

**See Also:**

Random(), RandomBernoulli(), RandomBinomial(), RandomDiscrete(),  
RandomExponential(), RandomLogNormal(), RandomNormal(),  
RandomUniform(), RandomizeTimer(), SeedRNG()

### 11.3.25 RandomLogNormal()

**Description:**

Returns a random number according to the log-normal distribution with parameters `<median>` and `<spread>`. Generated by calculating `$median * exp(spread * RandomNormal(0,1))$`. `<spread>` is a shape parameter, and only affects the variance as a function of the median; similar to the coefficient of variation. A value near 0 is a sharp distribution (.1-.3), larger values are more spread out; values greater than 2 make little difference in the shape.

**Usage:**

```
RandomLogNormal(<median>, <spread>)
```

**Example:**

```
RandomLogNormal(5000, .1)
```

**See Also:**

Random(), RandomBernoulli(), RandomBinomial(), RandomDiscrete(),  
RandomExponential(), RandomLogistic(), RandomNormal(),  
RandomUniform(), RandomizeTimer(), SeedRNG()

### 11.3.26 RandomNormal()

**Description:**

Returns a random number according to the standard normal distribution with <mean> and <stdev>.

**Usage:**

```
RandomNormal(<mean>, <stdev>)
```

**See Also:**

Random(), RandomBernoulli(), RandomBinomial(), RandomDiscrete(),  
RandomExponential(), RandomLogistic(), RandomLogNormal(),  
RandomUniform(), RandomizeTimer(), SeedRNG()

### 11.3.27 RandomUniform()

**Description:**

Returns a random floating-point number between 0 and <num>.

**Usage:**

```
RandomUniform(<num>)
```

**See Also:**

Random(), RandomBernoulli(), RandomBinomial(), RandomDiscrete(),  
RandomExponential(), RandomLogistic(), RandomLogNormal(),  
RandomNormal(), RandomizeTimer(), SeedRNG()

### 11.3.28 Round()

**Description:**

Rounds <num> to nearest integer, or if optional <precision> argument is included, to nearest  $10^{-\text{precision}}$ .

**Usage:**

```
Round(<num>)  
Round(<num>, <precision>)
```

**Example:**

```
Round(33.23)      # == 33
Round(56.65)      # == 57
Round(33.12234,2) # == 33.12
Round(43134.23,-2) # == 43100
```

**See Also:**

`Ceiling()`, `Floor()`, `AbsFloor()`, `ToInt()`

### 11.3.29 SeedRNG()

**Description:**

Seeds the random number generator with <num> to reproduce a random sequence. This function can be used cleverly to create a multi-session experiment: Start by seeding the RNG with a single number for each subject; generate the stimulus sequence, then extract the appropriate stimuli for the current block. Remember to `RandomizeTimer()` afterward if necessary.

**Usage:**

```
SeedRNG(<num>)
```

**Example:**

```
##This makes sure you get the same random order
## across sessions for individual subjects.
SeedRNG(gSubNum)
stimTmp <- Sequence(1:100,1)
stim <- Shuffle(stimTmp)
RandomizeTimer()
```

**See Also:**

`RandomizeTimer()`

### 11.3.30 Sign()

*Returns +1 or -1, depending on sign of argument*

**Description:**

Returns +1 or -1, depending on sign of argument.

**Usage:**

```
Sign(<num>)
```

**Example:**

```
Sign(-332.1)  # == -1  
Sign(65)     # == 1
```

**See Also:**

Abs()

### 11.3.31 Sin()

**Description:**

Sine of <deg> degrees.

**Usage:**

```
Sin(<deg>)
```

**Example:**

```
Sin(180)  
Sin(0)
```

**See Also:**

Cos(), Tan(), ATan(), ACos(), ATan()

### 11.3.32 Sqrt()

**Description:**

Square root of <num>.

**Usage:**

```
Sqrt(<num>)
```

**Example:**

```
Sqrt(100)  # == 10
```

### 11.3.33 Tan()

**Description:**

Tangent of <deg> degrees.

**Usage:**

```
Tan(<deg>)
```

**Example:**

```
Tan(180)
```

**See Also:**

Cos(), Sin(), ATan(), ACos(), ATan()

### 11.3.34 ToFloat()

*Converts number to internal floating-point representation*

**Description:**

Converts number to internal floating-point representation.

**Usage:**

```
ToFloat(<number>)
```

### 11.3.35 ToInteger()

*Rounds a number to an integer, and changes internal representation*

**Description:**

Rounds a number to an integer, changing internal representation.

**Usage:**

```
ToInteger(<number>)  
ToInteger(<floating-point>)  
ToInteger(<string-as-number>)
```

**Example:**

```
ToInteger(33.332) # == 33  
ToInteger("3213") # == 3213
```

**See Also:**

Round(), Ceiling(), AbsCeiling(), Floor(), AbsFloor()

### 11.3.36 ToNumber()

**Description:**

Converts a variant to a number. Most useful for character strings that are interpretable as a number, but may also work for other subtypes.

**Usage:**

```
ToNumber(<string>)  
ToNumber(<number>)
```

**Example:**

```
a <- ToNumber("3232")  
Print(a + 1)           # produces the output 3233.
```

**See Also:**

ToString(), ToFloat(), Round()

### 11.3.37 ToString()

*Converts a numerical value to a string representation*

**Description:**

Converts value to a string representation. Most useful for numerical values. This conversion is done automatically when strings are combined with numbers.

**Usage:**

```
ToString(<number>)  
ToString(<string>)
```

**Example:**

```
a <- ToString(333.232)  
Print(a + "111")  
# produces the output '333.232111'.
```

**See Also:**

ToString(), +.

## 11.4 PEBLObjects - Graphics and Objects

This module contains functions for creating and manipulating graphical objects, windows, and visual elements.

### Function Index

- *AddObject()*
- *Bezier()*
- *Circle()*
- *Draw()*
- *DrawFor()*
- *Ellipse()*
- *GetCursorPosition()*
- *GetLineBreaks()*
- *GetParent()*

- *PropertyExists()*
- *Rectangle()*
- *RemoveObject()*
- *ResizeWindow()*
- *RotoZoom()*
- *SaveAudioToWaveFile()*
- *RecordToBuffer()*
- *StartAudioMonitor()*
- *StopAudioMonitor()*
- *GetAudioStats()*
- *SetCursorPosition()*
- *SetEditable()*
- *SetFont()*
- *SetPanning()*
- *SetPlayRepeats()*
- *SetProperty()*
- *SetPixel()*
- *SetPoint()*

- *SetText()*
- *Show()*
- *Square()*
- *StartPlayback()*
- *Stop()*
- *ThickLine()*

### 11.4.1 AddObject()

*Adds an object to a parent object (window)*

**Description:**

Adds a widget to a parent window, at the top of the object stack. Once added, the object will be drawn onto the parent last, meaning it will be on top of anything previously added. In general, objects can be added to other objects as well as windows. For example, you can add drawing objects (circles, etc.) to an image to annotate the image and maintain its proper x,y coordinates. Also, if you ‘re-add’ an object that is already on a widget, it will get automatically removed from the window first. This is an easy way to reorder elements on a screen.

```
AddObject(<obj>, <window>) AddObject(<obj>, <canvas>) AddObject(  
↪<obj>, <widget>)
```

**Example:**

```
define Start(p)  
{  
  win <- MakeWindow()  
  img <- MakeImage("pebl.png")  
  circ <- Circle(20,20,10,MakeColor("red"),1)  
  AddObject(circ,img)  
  AddObject(img,win)  
  Move(img,100,100)  
  Draw()  
  WaitForAnyKeyPress()  
}
```

**See Also:**

`RemoveObject()`

### 11.4.2 Bezier()

*Creates bezier curve centered at x,y with relative points*

**Description:**

Creates a smoothed line through the points specified by <xpoints>, <ypoints>. The lists <xpoints> and <ypoints> are adjusted by <x> and <y>, so they should be relative to 0, not the location you want the points to be at. Like other drawn objects, the bezier must then be added to the window to appear. <steps> denotes how smooth the approximation will be.

**Usage:**

```
Bezier(<x>,<y>,<xpoints>,<ypoints>,  
      <steps>,<color>)
```

**Example:**

```
win <- MakeWindow()  
#This makes a T  
xpoints <- [-10,10,10,20,20,-20,-20,-10]  
ypoints <- [-20,-20,40,40,50,50,40,40]  
p1 <- Bezier(100,100,xpoints, ypoints,  
            5, MakeColor("black"))  
AddObject(p1,win)  
Draw()
```

**See Also:**

BlockE(), Polygon(), MakeStarPoints(), MakeNGonPoints()

### 11.4.3 Circle()

*Creates circle with radius r centered at position x,y*

**Description:**

Creates a circle for graphing at x,y with radius r. Circles must be added to a parent widget before it can be drawn; it may be added to widgets other than a base window. The properties of circles may be changed by accessing their properties directly, including the FILLED property which makes the object an outline versus a filled shape.

**Usage:**

```
Circle(<x>, <y>, <r>,<color>)
```

**Example:**

```
c <- Circle(30,30,20, MakeColor(green))
AddObject(c, win)
Draw()
```

**See Also:**

Square(), Ellipse(), Rectangle(), Line()

### 11.4.4 Draw()

*Redraws a widget and its children*

**Description:**

Redraws the screen or a specific widget.

**Usage:**

```
Draw()
Draw(<object>)
```

**See Also:**

DrawFor(), Show(), Hide()

### 11.4.5 DrawFor()

**Description:**

Draws a screen or widget, returning after <cycles> refreshes. This function currently does not work as intended in the SDL implementation, because of a lack of control over the refresh blank. It may work in the future.

**Usage:**

```
DrawFor( <object>, <cycles>)
```

**See Also:**

Draw(), Show(), Hide()

### 11.4.6 Ellipse()

*Creates ellipse with radii rx and ry centered at position x,y*

**Description:**

Creates a ellipse for graphing at x,y with radii rx and ry. Ellipses are only currently definable oriented in horizontal/vertical directions. Ellipses must be added to a parent widget before it can be drawn; it may be added to widgets other than a base window. The properties of ellipses may be changed by accessing their properties directly, including the FILLED property which makes the object an outline versus a filled shape.

**Usage:**

```
Ellipse(<x>, <y>, <rx>, <ry>,<color>)
```

**Example:**

```
e <- Ellipse(30,30,20,10, MakeColor(green))
AddObject(e, win)
Draw()
```

**See Also:**

Square(), Circle(), Rectangle(), Line()

### 11.4.7 GetCursorPosition()

**Description:**

Returns an integer specifying where in a textbox the edit cursor is. The value indicates which character it is on.

**Usage:**

```
GetCursorPosition(<textbox>)
```

**See Also:**

SetCursorPosition(), MakeTextBox(), SetText()

### 11.4.8 GetLineBreaks()

**Description:**

This gets linebreaks for a textbox. It is mainly used internally for text rendering/layout, but could be useful in other contexts.

**Example:**

```
gWin <- MakeWindow()
obj <- EasyTextbox("test a b c
d e f
g h i j k
l m n o p q r
s t u v",30,30,gWin,22, 40,200)

breaks <- GetLineBreaks(obj)
Print("Number of lines:" + Length(breaks))
```

### 11.4.9 GetParent()

**Description:**

This gets parent of a widget.

**Example:**

```
gWin <- MakeWindow()
obj <- EasyLabel("test",30,30,gWin,22)

## later

win <- GetParent(obj) ##should be gWin
```

### 11.4.10 GetPixelColor()

*Gets the color of a specified pixel on a widget*

**Description:**

Gets a color object specifying the color of a particular pixel on a widget.

**Usage:**

```
color <- GetPixelColor(widget,x,y)
```

**Example:**

```
##Judge brightness of a pixel
img <- MakeImage("test.png")
col <- GetPixelColor(img,20,20)
hsv <- RGBtoHSV(col)
Print(Third(hsv))
```

See Also:

SetPixel()

### 11.4.11 GetProperty()

*Returns value of property*

**Description:**

Gets a particular named property of an object. This works for custom or built-in objects. If the property does not exist, a fatal error will be signaled, and so you should check using PropertyExists() if there is any chance the property does not exist.

**Example:**

```
obj <- MakeCustomObject("myobject")
obj.taste <- "buttery"
obj.texture <- "creamy"
SetProperty(obj,"flavor","tasty")

list <- GetPropertyList(obj)
loop(i,list)
{
  if(PropertyExists(obj,i)
  {
    Print(i + ": " + GetProperty(obj,i))
  }
}
```

See Also:

GetPropertyList(),                      PropertyExists(),                      SetProperty(),  
MakeCustomObject(), PrintProperties()

### 11.4.12 GetPropertyList()

*Gets a list of all the property names of an object*

**Description:**

Gets a list of all of the properties an object has. This works for custom or built-in objects.

**Example:**

```
obj <- MakeCustomObject("myobject")
obj.taste <- "buttery"
obj.texture <- "creamy"
SetProperty(obj,"flavor","tasty")

list <- GetPropertyList(obj)
loop(i,list)
{
  if(PropertyExists(obj,i)
  {
    Print(i + ": " + GetProperty(obj,i))
  }
}
```

**See Also:**

GetProperty(), PropertyExists(), SetProperty() MakeCustomObject(), PrintProperties()

### 11.4.13 GetSize()

**Description:**

Returns a list of [height, width], specifying the size of the widget. The .width and .height properties can also be used instead of this function

**Usage:**

```
GetSize(<widget>)
```

**Example:**

```
image <- MakeImage("stim1.bmp")
xy <- GetSize(image)
x <- Nth(xy, 1)
y <- Nth(xy, 2)
```

#### 11.4.14 GetText()

*Returns the text in a textbox or label*

**Description:**

Returns the text stored in a text object (either a textbox or a label). The .text properties can also be used instead of this function.

**Usage:**

```
GetText(<widget>)
```

**See Also:**

SetCursorPosition(),      GetCursorPosition(),      SetEditable(),  
MakeTextBox()

#### 11.4.15 GetVocalResponseTime()

*A simple voice key*

**Description:**

This is a simple audio amplitude voice key controlled by two parameters *ONLY AVAILABLE ON WINDOWS AND LINUX*.

**Usage:**

```
GetVocalResponseTime(buffer,  
                      timethreshold,  
                      energythreshold)
```

**Example:**

```
buffer <- MakeAudioInputBuffer(5000)  
resp0 <- GetVocalResponseTime(buffer,.35, 200)  
SaveAudioToWaveFile("output.wav",buffer)
```

**See Also:**

MakeAudioInputBuffer(), SaveAudioToWaveFile(),

### 11.4.16 Hide()

*Hides an object*

**Description:**

Makes an object invisible, so it will not be drawn.

**Usage:**

```
Hide(<object>)
```

**Example:**

```
window <- MakeWindow()
image1 <- MakeImage("pebl.bmp")
image2 <- MakeImage("pebl.bmp")
AddObject(image1, window)
AddObject(image2, window)
Hide(image1)
Hide(image2)
Draw()           # empty screen will be drawn.

Wait(3000)
Show(image2)
Draw()           # image2 will appear.

Hide(image2)
Draw()           # image2 will disappear.

Wait(1000)
Show(image1)
Draw()           # image1 will appear.
```

**See Also:**

Show()

### 11.4.17 Line()

*Creates line starting at x,y and ending at x+dx, y+dy*

**Description:**

Creates a line for graphing at x,y ending at x+dx, y+dy. dx and dy describe the size of the line. Lines must be added to a parent widget before it can be drawn; it may be added to widgets other than a base window. Properties of lines may be accessed and set later.

**Usage:**

```
Line(<x>, <y>, <dx>, <dy>, <color>)
```

**Example:**

```
1 <- Line(30,30,20,20, MakeColor("green")
  AddObject(1, win)
  Draw()
```

**See Also:**

Square(), Ellipse(), Rectangle(), Circle()

### 11.4.18 LoadAudioFile()

*Load an audio file*

**Description:**

Loads an audio file supported by the ffmpeg library. It is nearly identical to LoadMovie(), but only works for audio files (.ogg, .mp3, .wav, .aiff, .wma, et.). It creates a movie object, which can then be played using PlayMovie() or StartPlayback() functions. Currently, only supported on Windows and Linux. The ffmpeg (<http://ffmpeg.org>) library supports a wide range of audio formats, including most .wav, .mp3, .ogg, .flac, .aiff, .wma, and others. Currently, there appears to sometimes be playback problems if the audio stream is not stereo, so be sure to convert your audio to stereo. Also, there appears to be some problems with .flac data formats. If you have problems with playback, you should verify that your media file loads with another ffmpeg media player.

**Usage:**

```
LoadAudioFile(audiofile)
```

**Example:**

```
movie <- LoadAudioFile("instuctions.mp3")
  PrintProperties(inst)
  PlayMovie(inst)
  PausePlayback(insnt)
```

**See Also:**

LoadMovie(), PlayMovie(), StartPlayback(), PausePlayback()

### 11.4.19 LoadMovie()

*Load a movie file*

**Description:**

DOES NOT WORK IN PEBL 2.0+ Loads a movie file using the ffmpeg library. It creates a movie object, which can then be played using PlayMovie() or StartPlayback() functions. Currently, only supported on Windows and Linux. The ffmpeg (<http://ffmpeg.org>) library supports a wide range of video and audio formats, including most .mpg, .avi, .ogg and .mp3 type formats. Audio-only formats should load and play with LoadMovie, but another function, LoadAudioFile(), has been created for these, as they do not need to be added to a window to work. If you have problems with playback, you should verify that your media file loads with another ffmpeg media player. For technical reasons, a movie MUST be loaded directly onto a window, and not another widget.

**Usage:**

```
LoadMovie(movie, window, width, height)
```

**Example:**

```
movie <- LoadMovie("movie.avi", gWin, 640, 480)
PrintProperties(movie)
Move(movie, 20, 20)
Draw()
StartPlayback(movie)
Wait(500) #Play 500 ms of the movie.
PausePlayback(movie)
```

**See Also:**

LoadAudioFile(), LoadMovie(), PlayMovie(), StartPlayback(),  
PausePlayback()

### 11.4.20 LoadSound()

*Loads a soundfile from the filename, returning a variable that can be played*

**Description:**

Loads a soundfile from <filename>, returning a variable that can be played using the PlayForeground or PlayBackground functions. LoadSound As of PEBL version 2.1, LoadSound will load raw and compressed audio files of various sorts. This includes uncompressed .wav files, .mp3, .ogg, .flac, and .midi files. This is based on the sdl2\_mixer library, and so more details about the file formats accepted can be found by examining that library. Examples of using

LoadSound are found in `demo tests testaudio.pbl`. When the file gets loaded, it gets automatically transcoded into a stereo 44100-sampling rate audio stream, regardless of its original playback rate. We have reports that in some cases, this can cause some problems, especially if a mono file gets loaded multiple times in an experiment. If you experience playback problems, try converting your audio to stereo 44100 hz and see if it helps.

**Usage:**

```
LoadSound(<filename>)
```

**Example:**

```
woof <- LoadSound("dog.wav")
PlayBackground(woof)
Wait(200)
Stop(woof)
PlayForeground(woof)
```

**See Also:**

PlayForeground(), PlayBackground(), LoadAudioFile(), LoadMovie()

### 11.4.21 MakeAudioInputBuffer()

*Creates a buffer to record audio input*

**Description:**

Creates a sound buffer to use for audio recording or voicekey sound input. It is currently very simple, allowing only to set the duration. By default, it record mono at 44100 hz.

**Usage:**

```
MakeAudioInputBuffer(<time-in-ms>)
```

**Example:**

```
buffer <- MakeAudioInputBuffer(5000)
resp0 <- GetVocalResponseTime(buffer, .35, 200)
SaveAudioToWaveFile("output.wav", buffer)
```

**See Also:**

GetVocalResponseTime(), SaveAudioToWaveFile(),

### 11.4.22 MakeCanvas()

*Creates a blank canvas*

#### Description:

Makes a canvas object `<x>` pixels by `y` pixels, in color `<color>`. A canvas is an object that other objects can be attached to, and imprinted upon. When the canvas gets moved, the attached objects move as well. The background of a canvas can be made invisible by using a color with alpha channel == 0. The `SetPixel` and `SetPoint` functions let you change individual pixels on a canvas, to enable adding noise, drawing functional images, etc. A canvas gets ‘cleared’ by calling `ResetCanvas(canvas)`. Any object added to a canvas creates an ‘imprint’ on the canvas that remains if the object is moved. This allows you to use another image as a paintbrush on the canvas, and lets you to add noise to text. Because a text label gets re-rendered when its drawn, if you want to add pixel noise to a stimulus, you can create a label, add it to a canvas, then add pixel noise to the canvas.

#### Usage:

```
MakeCanvas(<x>, <y>, <color>)
```

#### Example:

```
gWin <- MakeWindow()
clear <- MakeColor("white")
clear.alpha <- 0
#make a transparent canvas:
x <- MakeCanvas(300,300,clear)
AddObject(x,gWin)
Move(x,300,300)
img <- MakeImage("pebl.png")
AddObject(img,x)
Move(img,100,100)
Draw(x)           #imprint the image on the canvas
Move(img,100,200)
Draw(x)           #imprint the image on the canvas
Hide(img)

#draw a line on the canvas
i <- 10
red <- MakeColor("red")
while(i < 200)
{
  SetPixel(x,20,i,red)
  i <- i + 1
}
```

(continues on next page)

(continued from previous page)

```
}  
Draw()  
WaitForAnyKeyPress()
```

**See Also:**

MakeImage(), SetPixel(), MakeGabor(), ResetCanvas()

### 11.4.23 MakeColor()

*Creates a color based on a color name*

**Description:**

Makes a color from <colorname> such as red'', ``green'', and nearly 800 others. Color names and corresponding RGB values can be found in ``doc/colors.txt.

**Usage:**

```
MakeColor(<colorname>)
```

**Example:**

```
green <- MakeColor("green")  
black <- MakeColor("black")
```

**See Also:**

MakeColorRGB(), RGBtoHSV()

### 11.4.24 MakeColorRGB()

*Creates a color based on red, green, and blue values*

**Description:**

Makes an RGB color by specifying <red>, <green>, and <blue> values (between 0 and 255).

**Usage:**

```
MakeColorRGB(<red>, <green>, <blue>)
```

**See Also:**

MakeColor(), RGBtoHSV()

### 11.4.25 MakeCustomObject()

*Creates custom object.*

**Description:**

Creates a ‘custom’ object that can encapsulate multiple properties. It takes a name as an argument, but this is currently not accessible.

**Example:**

```
obj <- MakeCustomObject("myobject")
obj.taste <- "buttery"
obj.texture <- "creamy"
SetProperty(obj,"flavor","tasty")

list <- GetPropertyList(obj)
loop(i,list)
{
  if(PropertyExists(obj,i)
  {
    Print(i + ": " + GetProperty(obj,i))
  }
}
```

**See Also:**

GetPropertyList(), PropertyExists(), SetProperty(), IsCustomObject(),  
PrintProperties(), GetProperty()

### 11.4.26 MakeFont()

*Creates a font which can be used to make labels*

**Description:**

Makes a font. The first argument must be a text name of a font. The font can reside anywhere in PEBL’s search path, which would primarily include the media/fonts directory, and the working directory (where the script is saved).

- style changes from normal to bold/underline, italic. 0=normal, 1=underline, 2=italic,3=bolditalic
- fgcolor and bgcolor need to be colors, not just names of colors
- if show-backing is 0, the font gets rendered with an invisible
- background; otherwise with a bgcolor background. (Note: previous to PEBL 0.11, the final argument = 0 rendered the font with non anti-aliased background, which I can see almost no use for.)

**Usage:**

```
MakeFont(<ttf_filename>, <style>, <size>,  
        <fgcolor>, <bgcolor>, <show-backing>)
```

**Example:**

```
font <- MakeFont("Vera.ttf",0,22,MakeColor("black"),  
                MakeColor("white"),1)
```

### 11.4.27 MakeImage()

*Creates an image by reading in an image file (jpg, gif, png, bmp, etc.)*

**Description:**

Makes an image widget from an image file. .bmp formats should be supported; others may be as well.

**Usage:**

```
MakeImage(<filename>)
```

### 11.4.28 MakeLabel()

**Description:**

Makes a text label for display on-screen. Text will be on a single line, and the Move() command centers <text> on the specified point.

**Usage:**

```
MakeLabel(<text>, <font>)
```

### 11.4.29 MakeSineWave()

*Creates a pure sine wave.*

**Description:**

Creates a sine wave that can be played using the Play() or PlayBackground() functions. It will create a single-channel sound at 44100 bitrate, 16 bit precision.

**Usage:**

```
MakeSineWave(<duration_in_ms>, <hz>, <amplitude>)
```

**Example:**

```
##Make a sound that is 1000 ms, but just play 300 ms
sound <- MakeSineWave(200, 220, 1000)
PlayBackground(sound)
Wait(300)
Stop(sound)
```

**See Also:**

PlayForeground(), PlayBackGround(), Stop()

### 11.4.30 MakeTextBox()

*Creates a sized box filled*

**Description:**

Creates a textbox in which to display text. Textboxes allow multiple lines of text to be rendered; automatically breaking the text into lines.

**Usage:**

```
MakeTextbox(<text>, <font>, <width>, <height>)
```

**Example:**

```
font <- MakeFont("Vera.ttf", 1, 12, MakeColor("red"),
MakeColor("green"), 1)
tb <- MakeTextBox("This is the text in the textbox",
font, 100, 250)
```

**See Also:**

MakeLabel(),      GetText(),      SetText(),      SetCursorPosition(),  
GetCursorPosition(), SetEditable()

### 11.4.31 MakeWindow()

*Creates main window, in color named by argument, or grey if no argument is named*

**Description:**

Creates a window to display things in. Background is specified by <color>.

**Usage:**

```
MakeWindow(opt:<color>, opt:<width>,opt:<height>)
```

**Example:**

```
win <- MakeWindow()
gWin <- MakeWindow("white")

##make a second window for debugging or experimenter data
→entry.
gWin2 <- MakeWindow("black",400,200)
```

### 11.4.32 Move()

**Description:**

Moves an object to a specified location. Images and Labels are moved according to their center; TextBoxes are moved according to their upper left corner.

**Usage:**

```
Move(<object>, <x>, <y>)
```

**Example:**

```
Move(label, 33, 100)
```

**See Also:**

MoveCorner(), MoveCenter(), X() and Y() properties.

### 11.4.33 PausePlayback()

*Pauses playback of movie*

**Description:**

Pauses a playing movie or audio stream. This is used for movies whose playback was initiated using `StartPlayback`, which then ran as background threads during a `Wait()` function.

**Usage:**

```
PausePlayBack(movie)
```

**Example:**

```
movie <- LoadMovie("movie.avi",gWin,640,480)
PrintProperties(movie)
Move(movie,20,20)
Draw()
StartPlayback(movie)
Wait(500) #Play 500 ms of the movie.
PausePlayback(movie)
Wait(500)
```

**See Also:**

`LoadAudioFile()`, `LoadMovie()`, `PlayMovie()`, `StartPlayback()`

### 11.4.34 PlayBackground()

*Plays the sound 'in the background', returning immediately*

**Description:**

Plays the sound 'in the background', returning immediately.

**Usage:**

```
PlayBackground(<sound>)
```

**Example:**

```
sound <- MakeSineWave(200, 220, 1000)
PlayBackground(sound)
Wait(300)
Stop(sound)
```

See Also:

PlayForeground(), Stop()

### 11.4.35 PlayForeground()

*Plays the sound ‘in the foreground’, not returning until the sound is complete*

**Description:**

Plays the sound ‘in the foreground’; does not return until the sound is complete.

**Usage:**

```
PlayForeground(<sound>)
```

**Example:**

```
sound <- MakeSineWave(200, 220, 1000)
PlayForeground(sound)
```

See Also:

PlayBackground(), Stop()

### 11.4.36 Polygon()

**Description:**

Creates a polygon in the shape of the points specified by <xpoints>, <ypoints>. The lists <xpoints> and <ypoints> are adjusted by <x> and <y>, so they should be relative to 0, not the location you want the points to be at. Like other drawn objects, the polygon must then be added to the window to appear.

**Usage:**

```
Polygon(<x>,<y>,<xpoints>,<ypoints>,  
        <color>,<filled>)
```

**Example:**

```
win <- MakeWindow()
#This makes a T
xpoints <- [-10,10,10,20,20,-20,-20,-10]
ypoints <- [-20,-20,40,40,50,50,40,40]
p1 <- Polygon(100,100,xpoints, ypoints,  
             MakeColor("black"),1)
```

(continues on next page)

(continued from previous page)

```
AddObject(p1,win)
Draw()
```

**See Also:**

BlockE(), Bezier(), MakeStarPoints(), MakeNGonPoints()

### 11.4.37 PrintProperties()

*Prints a list of all available properties of an object (for debugging)*

**Description:**

Prints .properties/values for any complex object. These include textboxes, fonts, colors, images, shapes, etc. Mostly useful as a debugging tool.

**Usage:**

```
PrintProperties(<object>)
```

**Example:**

```
win <- MakeWindow()
tb <- EasyTextbox("one",20,20,win,22,400,80)
PrintProperties(tb)
```

*##Output:*

```
-----
[CURSORPOS]: 0
[EDITABLE]: 0
[HEIGHT]: 80
[ROTATION]: 0
[TEXT]: one
[VISIBLE]: 1
[WIDTH]: 400
[X]: 20
[Y]: 20
[ZOOMX]: 1
[ZOOMY]: 1
-----
```

**See Also:**

Print()

### 11.4.38 PropertyExists()

*Determines whether a particular property exists*

#### Description:

Tests whether a particular named property exists. This works for custom or built-in objects. This is important to check properties that might not exist, because trying to `GetProperty` of a non-existent property will cause a fatal error.

#### Example:

```
obj <- MakeCustomObject("myobject")
obj.taste <- "buttery"
obj.texture <- "creamy"
SetProperty(obj,"flavor","tasty")

list <- GetPropertyList(obj)
loop(i,list)
{
  if(PropertyExists(obj,i)
  {
    Print(i + ": " + GetProperty(obj,i))
  }
}
```

#### See Also:

`GetPropertyList()`, `GetProperty()`, `SetProperty()` `MakeCustomObject()`, `PrintProperties()`

### 11.4.39 Rectangle()

*Creates rectangle with size (dx, dy) centered at position x,y*

#### Description:

Creates a rectangle for graphing at x,y with size dx and dy. Rectangles are only currently definable oriented in horizontal/vertical directions. A rectangle must be added to a parent widget before it can be drawn; it may be added to widgets other than a base window. The properties of rectangles may be changed by accessing their properties directly, including the `FILLED` property which makes the object an outline versus a filled shape.

#### Usage:

```
Rectangle(<x>, <y>, <dx>, <dy>, <color>)
```

**Example:**

```
r <- Rectangle(30,30,20,10, MakeColor(green))
AddObject(r, win)
Draw()
```

**See Also:**

Circle(), Ellipse(), Square(), Line()

### 11.4.40 RemoveObject()

*Removes an object from a parent window*

**Description:**

Removes a child widget from a parent. Useful if you are adding a local widget to a global window inside a loop. If you do not remove the object and only Hide() it, drawing will be sluggish. Objects that are local to a function are removed automatically when the function terminates, so you do not need to call RemoveObject() on them at the end of a function.

**Usage:**

```
RemoveObject(<object>, <parent>)
```

### 11.4.41 ResizeWindow()

*Resizes a window to a specified width and height*

**Description:**

Resizes an existing window to the specified dimensions. This allows you to dynamically change the size of a window during program execution.

**Usage:**

```
ResizeWindow(<window>, <width>, <height>)
```

**Example:**

```
win <- MakeWindow("grey")
##Start with default size, then resize
ResizeWindow(win, 1024, 768)
Draw()
```

**See Also:**

MakeWindow()

### 11.4.42 RotoZoom()

*Rotates and zooms a graphical widget*

**Description:**

Rotates and zooms a widget (such as an image or label) by specified amounts. The rotation parameter specifies rotation in degrees. The xzoom and yzoom parameters specify scaling factors for horizontal and vertical dimensions (1.0 = no change, 2.0 = double size, 0.5 = half size). The smooth parameter (0 or 1) determines whether to use anti-aliasing for smoother appearance.

**Usage:**

```
RotoZoom(<widget>, <rotation>, <xzoom>, <yzoom>, <smooth>)
```

**Example:**

```
img <- MakeImage("stimulus.png")
AddObject(img, win)
Move(img, 320, 240)

##Rotate 45 degrees, double size, with smoothing
RotoZoom(img, 45, 2.0, 2.0, 1)
Draw()

##Rotate 90 degrees, normal size, no smoothing
RotoZoom(img, 90, 1.0, 1.0, 0)
Draw()
```

**See Also:**

Move(), MakeImage(), MakeLabel()

### 11.4.43 SaveAudioToWaveFile()

*Saves buffer to a .wav file format*

**Description:**

Saves a buffer, recorded using the GetAudioInputBuffer, to a .wav file for later analysis or archive.

**Usage:**

```
SaveAudioToWaveFile(filename, buffer)
```

**Example:**

```
gResponseBuffer <- MakeAudioInputBuffer(5000)
  resp0 <- GetVocalResponseTime(gResponseBuffer,.35, 200)
  SaveAudioToWaveFile("output.wav",gResponseBuffer)
```

**See Also:**

GetVocalResponseTime(), MakeAudioInputBuffer(), RecordToBuffer()

#### 11.4.44 RecordToBuffer()

*Records audio input to a pre-allocated buffer*

**Description:**

Records audio from the microphone directly into a pre-allocated audio buffer. This function allows precise control over recording duration and provides a synchronous recording interface. The buffer must be created first using `MakeAudioInputBuffer()`. An optional duration parameter can specify recording time in milliseconds; if omitted, the function records for the full buffer duration. *ONLY AVAILABLE ON WINDOWS AND LINUX.*

**Usage:**

```
RecordToBuffer(<buffer>)
RecordToBuffer(<buffer>, <duration_ms>)
```

**Example:**

```
## Record for full buffer duration (5 seconds)
buffer <- MakeAudioInputBuffer(5000)
RecordToBuffer(buffer)
SaveAudioToWaveFile("recording.wav", buffer)

## Record for specific duration (3 seconds into 5 second buffer)
buffer <- MakeAudioInputBuffer(5000)
RecordToBuffer(buffer, 3000)
SaveAudioToWaveFile("recording-3s.wav", buffer)
```

**See Also:**

MakeAudioInputBuffer(), SaveAudioToWaveFile(),  
GetVocalResponseTime(), StartAudioMonitor()

### 11.4.45 StartAudioMonitor()

*Starts real-time audio monitoring with ring buffer*

#### Description:

Creates and starts an audio monitoring system that continuously records audio in a ring buffer. This is useful for real-time audio analysis, voice key calibration, and audio level visualization. The monitor runs in the background and can be queried with `GetAudioStats()` to retrieve recent audio statistics. The monitor must be stopped with `StopAudioMonitor()` to free audio hardware resources. *ONLY AVAILABLE ON WINDOWS AND LINUX.*

#### Usage:

```
StartAudioMonitor(<buffer_size_ms>)
```

#### Example:

```
## Start monitoring with 3-second ring buffer
monitor <- StartAudioMonitor(3000)

## Continuously check audio levels
loop(i, Sequence(1, 100, 1))
{
  Wait(100)
  stats <- GetAudioStats(monitor, 500) ## Last 500ms
  energy <- First(stats)
  Print("Energy: " + energy)
}

StopAudioMonitor(monitor)
```

#### See Also:

`StopAudioMonitor()`, `GetAudioStats()`, `GetVocalResponseTime()`

### 11.4.46 StopAudioMonitor()

*Stops audio monitoring and releases audio hardware*

#### Description:

Stops an audio monitor created by `StartAudioMonitor()` and releases the audio hardware. This function performs complete cleanup including pausing recording, closing the SDL audio device, and clearing global audio state. It is critical to call this function before starting other audio operations like

`GetVocalResponseTime()` to ensure the audio hardware is available. *ONLY AVAILABLE ON WINDOWS AND LINUX.*

**Usage:**

```
StopAudioMonitor(<monitor>)
```

**Example:**

```
## Monitor audio for 10 seconds then stop
monitor <- StartAudioMonitor(2000)
Wait(10000)
StopAudioMonitor(monitor)

## Now audio hardware is free for other operations
buffer <- MakeAudioInputBuffer(5000)
rt <- GetVocalResponseTime(buffer, 0.35, 200)
```

**See Also:**

`StartAudioMonitor()`, `GetAudioStats()`

### 11.4.47 GetAudioStats()

*Retrieves audio statistics from monitoring buffer*

**Description:**

Returns audio statistics from the most recent N milliseconds of an audio monitor created by `StartAudioMonitor()`. The function returns a list containing three values: [energy, power, rmssd]. Energy represents total signal energy, power represents average power, and rmssd (root mean square of successive differences) indicates signal variability. These statistics are useful for voice key calibration, detecting speech onset, and monitoring audio levels. *ONLY AVAILABLE ON WINDOWS AND LINUX.*

**Usage:**

```
GetAudioStats(<monitor>, <window_ms>)
```

**Example:**

```
## Monitor and display real-time audio statistics
monitor <- StartAudioMonitor(5000)

loop(i, Sequence(1, 50, 1))
{
```

(continues on next page)

(continued from previous page)

```
Wait(200)
stats <- GetAudioStats(monitor, 1000) ## Last 1 second
energy <- First(stats)
power <- Nth(stats, 2)
rmssd <- Third(stats)

Print("Energy: " + energy + " Power: " + power + " RMSSD: " +
↵+ rmssd)
}

StopAudioMonitor(monitor)
```

**See Also:**

StartAudioMonitor(), StopAudioMonitor(), GetVocalResponseTime()

### 11.4.48 SetCursorPosition()

**Description:**

Moves the editing cursor to a specified character position in a textbox.

**Usage:**

```
SetCursorPosition(<textbox>, <integer>)
```

**Example:**

```
SetCursorPosition(tb, 23)
```

**See Also:**

SetEditable(), GetCursorPosition(), SetText(), GetText()

### 11.4.49 SetEditable()

*Turns on or off the editing cursor*

**Description:**

Sets the `editable''` status of the textbox. All this really does is turns on or off the cursor; editing must be done with the (currently unsupported) device function ```GetInput()`.

**Usage:**

```
SetEditable()
```

**Example:**

```
SetEditable(tb, 0)
SetEditable(tb, 1)
```

**See Also:**

GetEditable()

### 11.4.50 SetFont()

*Changes the font of a text object*

**Description:**

Resets the font of a textbox or label. Change will not appear until the next `Draw()` function is called. Can be used, for example, to change the color of a label to give richer feedback about correctness on a trial (see example below). Font can also be set by assigning to the `object.font` property of an object.

**Usage:**

```
SetFont(<text-widget>, <font>)
```

**Example:**

```
fontGreen <- MakeFont("vera.ttf",1,22,
                     MakeColor("green"),
                     MakeColor("black"), 1)
fontRed   <- MakeFont("vera.ttf",1,22,
                     MakeColor("red"),
                     MakeColor("black"), 1)
label <- MakeLabel(fontGreen, "Correct")

#Do trial here.

if(response == 1)
{
  SetText(label, "CORRECT")
  SetFont(label, fontGreen)
} else {
  SetText(label, "INCORRECT")
  SetFont(label, fontRed)
```

(continues on next page)

(continued from previous page)

```
}  
Draw()
```

**See Also:**

SetText()

### 11.4.51 SetPanning()

*Sets volume of left and right channel.*

**Description:**

Sets the audio panning; the volume of the left and right audio channels.

**Usage:**

```
SetPanning(<audio>,<left>,<right>)
```

**Example:**

```
one <- LoadSound("1.wav")  
PlayForeground(one)  
SetPanning(one,1.0,0.0)  
PlayForeground(one)  
SetPanning(one,.5,.5)  
PlayForeground(one)
```

**See Also:**

LoadSound()

### 11.4.52 SetPlayRepeats()

*Sets a repeat count on a sound playback.*

**Description:**

Sets repetition count on an audio file. When played back, i will play this sound reps+1 times. If set to 0, it will play just once. If set to -1, it will repeat indefinitely.

**Usage:**

```
SetPlayRepeats(<audio>,<reps>)
```

**Example:**

```
one <- LoadSound("1.wav")
  PlayForeground(one)
  SetPlayRepeats(one,5)
  PlayForeground(one)
  SetPanning(one,-1)
  PlayBackground(one)
  Wait(5000)
  Stop(one)
```

**See Also:**

LoadSound()

### 11.4.53 SetProperty()

*Sets property of an object*

**Description:**

Sets a a property of a custom object. This works for custom or built-in objects, but new properties can only be set on custom object. This function works essentially identically to the obj.property assignment, but it allows you to create property names from input. It is used extensively for the PEBL parameter setting.

**Example:**

```
obj <- MakeCustomObject("myobject")
obj.taste <- "buttery"
obj.texture <- "creamy"
SetProperty(obj,"flavor","tasty")

list <- GetPropertyList(obj)
loop(i,list)
{
  if(PropertyExists(obj,i)
  {
    Print(i + ": " + GetProperty(obj,i))
  }
}
```

**See Also:**

GetProperty(),                      PropertyExists(),                      GetPropertyList(),  
MakeCustomObject(), PrintProperties()

### 11.4.54 SetPixel()

*Sets the color of a pixel at specified coordinates*

**Description:**

Sets the pixel at x,y to a particular color. SetPixel is primarily useful for images and canvases—labels and textboxes get re-rendered upon draw so any use of SetPixel will get overwritten when it gets drawn. It won't work on windows or shapes. This function can also be called using SetPoint().

**Usage:**

```
SetPixel(<widget>, <x>, <y>, <color>)
```

**Example:**

```
back <- MakeCanvas(50,50)
AddObject(back,gWin)
col <- MakeColor("green")
xy <- [[10,10],[10,11],[10,12],[10,13]]
loop(i,xy)
{
  SetPixel(back, First(i), Second(i), col)
}
Draw()
```

**See Also:**

SetPoint(), MakeGabor(), MakeCanvas(), GetPixelColor()

### 11.4.55 SetPoint()

*Sets the color of a point at specified coordinates (alias for SetPixel)*

**Description:**

Sets the pixel at x,y to a particular color. SetPoint is an alias for SetPixel() and functions identically. It is primarily useful for images and canvases—labels and textboxes get re-rendered upon draw so any use of SetPoint will get overwritten when it gets drawn. It won't work on windows or shapes.

**Usage:**

```
SetPoint(<widget>, <x>, <y>, <color>)
```

**Example:**

```
back <- MakeCanvas(50,50)
AddObject(back,gWin)
col <- MakeColor("green")
xy <- [[10,10],[10,11],[10,12],[10,13]]
loop(i,xy)
{
  SetPoint(back, First(i), Second(i), col)
}
Draw()
```

**See Also:**

SetPixel(), MakeGabor(), MakeCanvas(), GetPixelColor()

### 11.4.56 SetText()

*Sets the text in a textbox or label*

**Description:**

Resets the text of a textbox or label. Change will not appear until the next Draw() function is called. The object.text property can also be used to change text of an object, by doing: object.text <- "new text"

**Usage:**

```
SetText(<text-widget>, <text>)
```

**Example:**

```
# Fixation Cross:
label <- MakeLabel(font, "+")
Draw()

SetText(label, "X")
Wait(100)
Draw()
```

**See Also:**

GetText(), SetFont()

### 11.4.57 Show()

*Shows an object*

#### Description:

Sets a widget to visible, once it has been added to a parent widget. This just changes the visibility property, it does not make the widget appear. The widget will not be displayed until the `Draw()` function is called. The `.visible` property of objects can also be used to hide or show the object.

#### Usage:

```
Show(<object>)
```

#### Example:

```
window <- MakeWindow()
image1 <- MakeImage("pebl.bmp")
image2 <- MakeImage("pebl.bmp")
AddObject(image1, window)
AddObject(image2, window)
Hide(image2)
Draw()
Wait(300)
Show(image2)
Draw()
```

#### See Also:

`Hide()`

### 11.4.58 Square()

*Creates square with width size centered at position x,y*

#### Description:

Creates a square for graphing at x,y with size <size>. Squares are only currently definable oriented in horizontal/vertical directions. A square must be added to a parent widget before it can be drawn; it may be added to widgets other than a base window. The properties of squares may be changed by accessing their properties directly, including the `FILLED` property which makes the object an outline versus a filled shape.

#### Usage:

```
Ellipse(<x>, <y>, <size>, <color>)
```

**Example:**

```
s <- Square(30,30,20, MakeColor(green))
AddObject(s, win)
Draw()
```

**See Also:**

Circle(), Ellipse(), Rectangle(), Line()

### 11.4.59 StartPlayback()

*Initiates playback in background, updated with Wait()*

**Description:**

Initiates playback of a movie so that it will play in the background when a Wait() or WaitFor() function is called. This allows one to collect a response while playing a movie. The movie will not actually play until the event loop is started, typically with something like Wait().

**Usage:**

```
StartPlayBack(movie)
```

**Example:**

```
movie <- LoadMovie("movie.avi", gWin, 640, 480)
PrintProperties(movie)
Move(movie, 20, 20)
Draw()
StartPlayback(movie)
Wait(500) #Play 500 ms of the movie.
PausePlayback(movie)
```

**See Also:**

LoadAudioFile(), LoadMovie(), PlayMovie(), PausePlayback()

### 11.4.60 Stop()

*Stops a sound playing in the background from playing*

**Description:**

Stops a sound playing in the background from playing. Calling Stop() on a sound object that is not playing should have no effect, but if an object is aliased, Stop() will stop the file. Note that sounds play in a separate thread,

so interrupting the thread has a granularity up to the duration of the thread-switching quantum on your computer; this may be tens of milliseconds.

**Usage:**

```
Stop(<sound-object>)
```

**Example:**

```
buzz <- LoadSound("buzz.wav")
PlayBackground(buzz)
Wait(50)
Stop(buzz)
```

**See Also:**

PlayForeground(), PlayBackGround()

### 11.4.61 ThickLine()

*Creates a thick line between two points*

**Description:**

Makes a thick line between two coordinates. This uses the SDL\_gfx thickline primitive.

**Usage:**

```
ThickLine(<x1>,<y1>,<x2>,<y2>,  
          <size-in-pixels>,<color>)
```

**Example:**

```
a <- ThickLine(10,10,300,400,20,  
               MakeColor("red"))  
AddObject(a,gWin)  
Draw()
```

**See Also:**

Line(), Polygon()

## 11.5 PEBLStream - File and Network I/O

This module contains functions for file I/O, network communication, and data streaming.

### Function Index

- *AppendFile()*
- *AcceptNetworkConnection()*
- *CheckForNetworkConnection()*
- *CloseNetworkConnection()*
- *ConnectToHost()*
- *ConnectToIP()*
- *CopyFile()*
- *EndOfFile()*
- *EndOfLine()*
- *FileClose()*
- *FileOpenAppend()*
- *FileOpenOverwrite()*
- *FileOpenRead()*
- *FileOpenWrite()*
- *FilePrint()*
- *FileReadCharacter()*
- *FileReadLine()*
- *FileReadList()*
- *FileReadTable()*
- *FileReadText()*
- *FileReadWord()*
- *MD5File()*
- *MD5Sum()*
- *GetData()*
- *GetMyIPAddress()*

- *GetPPortState()*
- *OpenCOMPort()*
- *OpenNetworkListener()*
- *OpenPPort()*
- *ParseJSON()*
- *Print()*
- *SendData()*
- *SetNetworkPort()*
- *SetPPortMode()*
- *SetPPortState()*
- *WaitForNetworkConnection()*
- *WritePNG()*
- *COMPortGetByte()*
- *COMPortSendByte()*
- *GetHTTPFile()*
- *GetHTTPText()*
- *PostHTTP()*
- *PostHTTPFile()*

### 11.5.1 AppendFile()

*Appends a file2 to file1*

**Description:**

Appends onto the end of <file1> the contents of <file2>. Useful for compiling pooled data at the end of an experiment.

**Usage:**

```
AppendFile(<file1>, <file2>)
```

**See Also:**

FileOpenWrite() , FileOpenAppend()

### 11.5.2 AcceptNetworkConnection()

*Accepts an incoming network connection on a listening port*

**Description:**

Accepts an incoming TCP/IP connection on a network listener that was opened using `OpenNetworkListener()`. Returns a network connection object that can be used to send and receive data. This is typically used after `CheckForNetworkConnection()` confirms a connection is available.

**Usage:**

```
AcceptNetworkConnection(<listener>, <port>)
```

**Example:**

```
listener <- OpenNetworkListener(4444)
if(CheckForNetworkConnection(listener))
{
  connection <- AcceptNetworkConnection(listener, 4444)
  SendData(connection, "Hello client!")
  CloseNetworkConnection(connection)
}
```

**See Also:**

`OpenNetworkListener()`, `CheckForNetworkConnection()`,  
`WaitForNetworkConnection()`, `CloseNetworkConnection()`

### 11.5.3 CheckForNetworkConnection()

**Description:**

Checks to see if there is an incoming TCP/IP connection on a network that is opened using `OpenNetworkListener`. This is an alternative to the `WaitForNetworkConnection` function that allows more flexibility (and allows updating the during waiting for the connection).

**Usage:**

```
net <- CheckForNetworkConnection(network)
```

**Example:**

```
network <- OpenNetworkListener(4444)
time <- GetTime()
while(not connected and (GetTime() < time + 5000))
```

(continues on next page)

(continued from previous page)

```
{  
  connected <- CheckForNetworkConnection(network)  
}
```

**See Also:**

OpenNetworkListener(), Getdata(), WaitForNetworkConnection(),  
CloseNetwork()

### 11.5.4 CloseNetworkConnection()

**Description:**

Closes network connection

**Usage:**

```
CloseNetwork(<network>)
```

**Example:**

```
net <- WaitForNetworkConnection("localhost",1234)  
SendData(net,"Watson, come here. I need you.")  
CloseNetworkConnection(net)
```

**See Also:**

ConnectToIP(), ConnectToHost(), WaitForNetworkConnection(),  
GetData(), SendData(), ConvertIPString()

### 11.5.5 ConnectToHost()

*Connects to a port on another computer, returning network object.*

**Description:**

Connects to a host computer waiting for a connection on <port>, returning a network object that can be used to communicate. Host is a text hostname, like "myname.indiana.edu", or use "localhost" to specify your current computer.

**Usage:**

```
ConnectToHost(<hostname>,<port>)
```

**See Also:**

`ConnectToIP()`, `GetData()`, `WaitForNetworkConnection()`, `SendData()`,  
`ConvertIPString()`, `CloseNetworkConnection()`

### 11.5.6 ConnectToIP()

*Connects to a port on another computer, returning network object.*

**Description:**

Connects to a host computer waiting for a connection on <port>, returning a network object that can be used to communicate. <ip> is a numeric ip address, which must be created with the `ConvertIPString(ip)` function.

**Usage:**

```
ConnectToIP(<ip>,<port>)
```

**See Also:**

`ConnectToHost()`, `GetData()`, `WaitForNetworkConnection()`, `SendData()`,  
`ConvertIPString()`, `CloseNetworkConnection()`

### 11.5.7 CopyFile()

*Makes a copy of a file*

**Description:**

This makes a copy of a specified file, by Copying the contents of one file to another. This makes the copy byte-by-byte (so should work for binary data). It is probably better to use a systemcall function to make a copy of an entire file at once. This is likely to be slower and possibly error-prone (i.e., permissions and other file properties may not copy.), but it is a useful cross-platform solution to creating a new file based on others. It copies by name from the current working directory.

**Example:**

```
base <- "template.txt"  
CopyFile(base,"newfile.txt")
```

**See Also:**

`DeleteFile()`, `AppendFile()` , `FileExists()`

### 11.5.8 EndOfFile()

*Returns true if at the end of a file*

**Description:**

Returns true if at the end of a file.

**Usage:**

```
EndOfFile(<filestream>)
```

**Example:**

```
while(not EndOfFile(fstream))
{
    Print(FileReadLine(fstream))
}
```

### 11.5.9 EndOfLine()

*Returns true if at end of line*

**Description:**

Returns true if at end of line.

**Usage:**

```
EndOfLine(<filestream>)
```

### 11.5.10 FileClose()

*Closes a filestream variable. Pass the variable name, not the filename*

**Description:**

Closes a filestream variable. Be sure to pass the variable name, not the filename.

**Usage:**

```
FileClose(<filestream>)
```

**Example:**

```
x <- FileOpenRead("file.txt")
# Do relevant stuff here.
FileClose(x)
```

**See Also:**

`FileOpenAppend()`, `FileOpenRead()`, `FileOpenWrite()`

### 11.5.11 FileOpenAppend()

*Opens a filename, returning a stream that can be used for writing info. Appends if the file already exists, opens if file does not*

**Description:**

Opens a filename, returning a stream that can be used for writing information. Appends if the file already exists.

**Usage:**

```
FileOpenAppend(<filename>)
```

**See Also:**

`FileClose()`, `FileOpenRead()`, `FileOpenWrite()`, `FileOpenOverWrite()`

### 11.5.12 FileOpenOverwrite()

*Opens a filename, returning a stream that can be used for writing information. Overwrites if file already exists*

**Description:**

Opens a filename, returning a stream that can be used for writing information. Overwrites if file already exists. This function should not be used for opening data files; instead, use `FileOpenWrite`, which saves to a backup file if the specified file already exists.

**Usage:**

```
FileOpenOverWrite(<filename>)
```

**See Also:**

`FileClose()`, `FileOpenAppend()`, `FileOpenRead()` `FileOpenWrite()`

### 11.5.13 FileOpenRead()

*Opens a filename, returning a stream to be used for reading information*

**Description:**

Opens a filename, returning a stream to be used for reading information.

**Usage:**

```
FileOpenRead(<filename>)
```

**See Also:**

FileClose(), FileOpenAppend(), FileOpenWrite(), FileOpenOverWrite()

### 11.5.14 FileOpenWrite()

*Opens a filename, returning a stream that can be used for writing information.  
Creates new file if file already exists*

**Description:**

Opens a filename, returning a stream that can be used for writing information. If the specified filename exists, it won't overwrite that file. Instead, it will create a related filename, appending a -integer before the filename extension.

**Usage:**

```
FileOpenWrite(<filename>)
```

**See Also:**

FileClose(), FileOpenAppend(), FileOpenRead(), FileOpenOverWrite()

### 11.5.15 FilePrint()

**Description:**

Like Print\_, but to a file. Prints a string to a file, without appending a newline character. Returns a copy of the string it prints.

**Usage:**

```
FilePrint_(<filestream>, <value>)
```

**Example:**

```
FilePrint_(fstream, "This line doesn't end.")
```

**See Also:**

`Print_()`, `FilePrint()`

### 11.5.16 `FileReadCharacter()`

*Reads and returns a single character from a filestream*

**Description:**

Reads and returns a single character from a filestream.

**Usage:**

```
FileReadCharacter(<filestream>)
```

**See Also:**

`FileReadList()`, `FileReadTable()` `FileReadLine()`, `FileReadText()`,  
`FileReadWord()`,

### 11.5.17 `FileReadLine()`

*Reads and returns a line from a file; all characters up until the next newline or the end of the file*

**Description:**

Reads and returns a line from a file; all characters up until the next newline or the end of the file.

**Usage:**

```
FileReadLine(<filestream>)
```

**See Also:**

`FileReadCharacter()`, `FileReadList()`, `FileReadTable()`, `FileReadText()`,  
`FileReadWord()`

### 11.5.18 `FileReadList()`

*Given a filename, will open it, read in all the items into a list (one item per line), and close the file afterwards*

**Description:**

Given a filename, will open it, read in all the items into a list (one item per line), and close the file afterward. Ignores blank lines or lines starting with

#. Useful with a number of pre-defined data files stored in `media/text/`. See Section [~ref{sec:media}](#): Provided Media Files.

**Usage:**

```
FileReadList(<filename>)
```

**Example:**

```
FileReadList("data.txt")
```

**See Also:**

`FileReadCharacter()`, `FileReadTable()` `FileReadLine()`, `FileReadText()`, `FileReadWord()`,

### 11.5.19 FileReadTable()

**Description:**

Reads a table directly from a file. Data in file should separated by spaces. Reads each line onto a sublist, with space-separated tokens as items in sublist. Ignores blank lines or lines beginning with #. Optionally, specify a token separator other than space.

**Usage:**

```
FileReadTable(<filename>, <optional-separator>)
```

**Example:**

```
a <- FileReadTable("data.txt")
```

**See Also:**

`FileReadCharacter()`, `FileReadList()`, `FileReadLine()`, `FileReadText()`, `FileReadWord()`

### 11.5.20 FileReadText()

*Reads all of the text in the file into a variable*

**Description:**

Returns all of the text from a file, ignoring any lines beginning with #. Opens and closes the file transparently.

**Usage:**

```
FileReadText(<filename>)
```

**Example:**

```
instructions <- FileReadText("instructions.txt")
```

**See Also:**

FileReadCharacter(), FileReadList(), FileReadTable(), FileReadLine(),  
FileReadWord()

### 11.5.21 FileReadWord()

**Description:**

Reads and returns a *word* from a file; the next connected stream of characters not including a `` or a newline. Will not read newline characters.

**Usage:**

```
FileReadWord(<filestream>)
```

**See Also:**

FileReadCharacter(), FileReadList(), FileReadTable(), FileReadLine(),  
FileReadText()

### 11.5.22 MD5File()

**Description:**

Computes MD5 checksum of a file. Returns blank if file does not exist.

**Usage:**

```
MD5File(<filename>)
```

**Example:**

```
text <- FileReadText("test.pbl")
Print(MD5Sum(text))
#returns: 3396a651bd3c96f9799ce02eecb48801; see similar example
↪ next

Print(MD5File("test.pbl"))
# returns 3396a651bd3c96f9799ce02eecb48801
```

(continues on next page)

(continued from previous page)

```
Print(MD5File("doesnotexist.txt"))  
#returns 0
```

**See Also:**

MD5Sum(), FileReadText()

### 11.5.23 MD5Sum()

**Description:**

Computes MD5 checksum on text. Returns blank if no string provided.

**Usage:**

```
MD5Sum(<text>)
```

**Example:**

```
Print(MD5Sum(""))  
#Return: d41d8cd98f00b204e9800998ecf8427e  
  
Print(MD5Sum("bananana"))  
#returns bb8e9af523e4aeffa88f1807fb2af9ce  
  
text <- FileReadText("test.pbl")  
Print(MD5Sum(text))  
#returns: 3396a651bd3c96f9799ce02eeeb48801
```

**See Also:**

MD5File(), FileReadText()

### 11.5.24 GetData()

*return a string from network connection*

**Description:**

Gets Data from network connection. Example of usage in demo/nim.pbl.

**Usage:**

```
val <- GetData(<network>,<size>)
```

**See Also:**

ConnectToIP(), ConnectToHost(), WaitForNetworkConnection(),  
SendData(), ConvertIPString(), CloseNetworkConnection()

### 11.5.25 GetMyIPAddress()

*Returns the local IP address of this computer*

**Description:**

Returns the IP address of the current computer as a formatted string. The returned address is suitable for use in networking functions. If multiple network interfaces are present, it typically returns the primary interface address.

**Usage:**

```
GetMyIPAddress(<interface_number>)
```

**Example:**

```
myIP <- GetMyIPAddress(0)  
Print("My IP address is: " + myIP)
```

**See Also:**

ConnectToHost(), ConnectToIP(), OpenNetworkListener()

### 11.5.26 GetPPortState()

*Gets state of parallel port data bits*

**Description:**

Gets the parallel port state, as a list of 8 ‘bits’ (1s or 0s).

**See Also:**

COMPortGetByte(), COMPortSendByte(), OpenPPort() OpenCOMPort(),  
SetPPortMode(), GetPPortState()

### 11.5.27 OpenCOMPort()

*Opens a serial (com) port*

#### Description:

This opens a COM/Serial port, and is used by many usb devices for communication. The general process is to use OpenComPort to create the port, and then send and receive text strings from that port. These are sent one byte at a time. The mode argument is a 3-character string that specifies aspects of the mode (see Teunis van Beelen's rs232 library at <http://www.teuniz.net/RS-232/>. The first character is the data bits (5,6,7 or 8), parity (N=none, E=even, O=odd), and the third is the stop bit (1 or 2 bits). Within the demodirectory, there is some basic code for communicating with the cedrus response box that uses these functions. In addition, that script provide a NumToASCII() function that can be useful in translating numbers to strings to communicate with a device.

#### Example:

```
port <- OpenCOMPort(16,9600,"8N1")
Print( ComPortGetByte(port))
```

#### See Also:

COMPortGetByte(), COMPortSendByte(), OpenPPort(), SetPPortMode(), GetPPortMode()

### 11.5.28 OpenNetworkListener()

*Opens a port for listening*

#### Description:

Creates a network object that listens on a particular port, and is able to accept incoming connections. You can the nuse CheckForNetworkConnections to accept incoming connections. This is an alternative to the WaitForNetworkConnection function that allows more flexibility (and allows updating the during waiting for the connection).

#### Usage:

```
net <- OpennetworkListener(port)
```

#### Example:

```
network <- OpenNetworkListener(4444)
time <- GetTime()
while(not connected and (GetTime() < time + 5000))
```

(continues on next page)

(continued from previous page)

```
{  
  connected <- CheckForNetworkConnection(network)  
}
```

**See Also:**

**CheckForNetworkConnection()**, **Getdata()**, **WaitForNetworkConnection()**, **CloseNetwork()**

### 11.5.29 **OpenPPort()**

*Opens parallel port*

**Description:**

Opens a Parallel port, returning an object that can be used for parallel port communications.

**See Also:**

**COMPortGetByte()**, **COMPortSendByte()**, **OpenCOMPort()**, **SetPPortMode()**, **GetPPortMode()**

### 11.5.30 **ParseJSON()**

*Parses a JSON string into PEBL data structures*

**Description:**

Parses a JSON-formatted string and converts it into PEBL data structures (lists and custom objects). JSON objects become PEBL custom objects with properties, and JSON arrays become PEBL lists. This is useful for working with web APIs and configuration files.

**Usage:**

```
ParseJSON(<json_string>)
```

**Example:**

```
jsonString <- GetHTTPText("https://api.example.com/data", "", "")  
data <- ParseJSON(jsonString)  
  
##Access parsed data  
Print(data.name)  
Print(data.values)
```

**See Also:**

`GetHTTPText()`, `JSONText()`, `PostHTTP()`, `MakeCustomObject()`

### 11.5.31 `Print()`

**Description:**

Prints <value> to stdout; doesn't append a newline afterwards.

**Usage:**

```
Print_(<value>)
```

**Example:**

```
Print_("This line")
Print_(" ")
Print_("and")
Print_(" ")
Print_("Another line")
# prints out: 'This line and Another line'
```

**See Also:**

`Print()`, `FilePrint()`

### 11.5.32 `SendData()`

*Sends a data string over connection.*

**Description:**

Sends data on network connection. Example of usage in `demo/nim.pbl`. You can only send text data.

**Usage:**

```
SendData(<network>, <data_as_string>)
```

**See Also:**

`ConnectToIP()`, `ConnectToHost()`, `WaitForNetworkConnection()`, `GetData()`, `ConvertIPString()`, `CloseNetworkConnection()`

### 11.5.33 SetNetworkPort()

*Configures the default network port for connections*

**Description:**

Sets the default network port number to be used for subsequent network operations. This allows you to configure the port once rather than specifying it for each connection. The port number should be between 1024 and 65535 for user applications.

**Usage:**

```
SetNetworkPort(<port>)
```

**Example:**

```
SetNetworkPort(8080)
listener <- OpenNetworkListener(8080)
```

**See Also:**

OpenNetworkListener(), ConnectToHost(), ConnectToIP()

### 11.5.34 SetPPortMode()

*Sets parallel port mode (input/output)*

**Description:**

Sets a parallel port mode, either “<input>” or “<output>”.

**See Also:**

COMPortGetByte(), COMPortSendByte(), OpenPPort() OpenCOMPort(), SetPPortMode(), GetPPortState()

### 11.5.35 SetPPortState()

*Sets parallel port state*

**Description:**

Sets a parallel port state, using a list of 8 ‘bits’ (1s or 0s).

**See Also:**

COMPortGetByte(), COMPortSendByte(), OpenPPort() OpenCOMPort(), SetPPortMode(), GetPPortState()

### 11.5.36 WaitForNetworkConnection()

#### Description:

Listens on a port, waiting until another computer or process connects. Return a network object that can be used for communication.

#### Usage:

```
WaitForNetworkConnection(<port>)
```

#### See Also:

ConnectToHost(), ConnectToIP(), GetData(),  
WaitForNetworkConnection(), SendData(), ConvertIPString(),  
CloseNetworkConnection()

### 11.5.37 WritePNG()

*Makes a .png from a window or object*

#### Description:

WritePNG() creates a graphic file of the screen or a widget on the screen. It can also be given an arbitrary widget. For the most part, widgets added to other widgets will be captured fine, but sometimes polygons and shapes added to other widgets may not appear in the output png.

#### Usage:

```
x <- WritePNG("screen1.png",gWin)

## Use like this to create an animated screencast
define DrawMe()
{
  pname <- "fileout"+ZeroPad(gid,5)+".png"
  Draw()
  WritePNG(pname,gWin)
}

define Start(p)
{
  gid <- 1
  gWin <- MakeWindow()
  img <- MakeImage("pebl.png")
  AddObject(img,gWin)
  while(gid < 100)
```

(continues on next page)

(continued from previous page)

```
{  
  Move(img,RandomDiscrete(800),  
        RandomDiscrete(600))  
  
  DrawMe()  
  gid <- gid + 1  
}  
  
}
```

**See Also:**

FileWriteTable()

### 11.5.38 COMPortGetByte()

*Gets a byte from the COM port*

**Description:**

Reads a single byte from an open COM/serial port. Returns the byte value as an integer (0-255). If no data is available, it returns -1. This is used for serial communication with external devices.

**Usage:**

```
COMPortGetByte(<port>)
```

**Example:**

```
port <- OpenCOMPort(1, 9600, "8N1")  
byte <- COMPortGetByte(port)  
if(byte >= 0)  
{  
  Print("Received byte: " + byte)  
}
```

**See Also:**

COMPortSendByte(), OpenCOMPort()

### 11.5.39 COMPortSendByte()

*Sends a byte to the COM port*

**Description:**

Sends a single byte to an open COM/serial port. The byte should be an integer value between 0 and 255. This is used for serial communication with external devices.

**Usage:**

```
COMPortSendByte(<port>, <byte>)
```

**Example:**

```
port <- OpenCOMPort(1, 9600, "8N1")
##Send ASCII 'A' (65)
COMPortSendByte(port, 65)
```

**See Also:**

COMPortGetByte(), OpenCOMPort()

### 11.5.40 GetHTTPFile()

*Downloads a file from a web server via HTTP*

**Description:**

Fetches a file from a web server using HTTP and saves it to a local file. Supports HTTP and HTTPS protocols. Useful for downloading stimuli, configuration files, or data from web servers during experiments.

**Usage:**

```
GetHTTPFile(<url>, <output_filename>, <username>, <password>)
```

**Example:**

```
##Download without authentication
success <- GetHTTPFile("http://example.com/data.csv", "local_
↳data.csv", "", "")

##Download with authentication
success <- GetHTTPFile("https://secure.example.com/file.zip",
↳"download.zip", "user", "pass")
```

**See Also:**

GetHTTPText(), PostHTTP(), PostHTTPFile()

### 11.5.41 GetHTTPText()

*Retrieves text content from a web server via HTTP*

**Description:**

Fetches content from a web server using HTTP and returns it as a text string. Supports HTTP and HTTPS protocols. Useful for retrieving instructions, configurations, or data from web services during experiments.

**Usage:**

```
GetHTTPText(<url>, <username>, <password>)
```

**Example:**

```
##Fetch text without authentication
text <- GetHTTPText("http://example.com/instructions.txt", "", "
↪")
Print(text)

##Fetch JSON data with authentication
jsonData <- GetHTTPText("https://api.example.com/config", "user",
↪ "pass")
config <- ParseJSON(jsonData)
```

**See Also:**

GetHTTPFile(), PostHTTP(), ParseJSON()

### 11.5.42 PostHTTP()

*Sends data to a web server via HTTP POST*

**Description:**

Sends data to a web server using the HTTP POST method. Returns the server's response as a string. This is useful for submitting experimental data to web servers, interacting with web APIs, or logging data remotely.

**Usage:**

```
PostHTTP(<url>, <post_data>, <username>, <password>, <content_
↪type>)
```

**Example:**

```
##Post form data
postData <- "subjectID=123&condition=A&score=85"
response <- PostHTTP("http://example.com/submit", postData, "", "
↳", "application/x-www-form-urlencoded")

##Post JSON data
jsonData <- "{\"subject\":123,\"rt\":450}"
response <- PostHTTP("https://api.example.com/data", jsonData,
↳"user", "pass", "application/json")
```

**See Also:**

PostHTTPFile(), GetHTTPText(), GetHTTPFile()

**11.5.43 PostHTTPFile()**

*Uploads a file to a web server via HTTP POST*

**Description:**

Uploads a file to a web server using HTTP POST multipart/form-data encoding. This is useful for uploading experimental data files, log files, or other content to a web server for storage or processing.

**Usage:**

```
PostHTTPFile(<url>, <filename>, <fieldname>, <username>,
↳<password>, <additional_fields>)
```

**Example:**

```
##Upload data file
response <- PostHTTPFile("http://example.com/upload", "data.csv",
↳ "datafile", "", "", "")

##Upload with additional form fields
additionalData <- "subjectID=123&session=1"
response <- PostHTTPFile("https://secure.example.com/upload",
↳"results.txt", "file", "user", "pass", additionalData)
```

**See Also:**

PostHTTP(), GetHTTPFile(), FileOpenRead()

## 11.6 PEBLString - String Manipulation

This module contains functions for string manipulation and formatting.

### Function Index

- *CopyToClipboard()*
- *FindInString()*
- *Format()*
- *Lowercase()*
- *SplitString()*
- *StringLength()*
- *SubString()*
- *ToASCII()*
- *Uppercase()*
- *DetectTextScript()*
- *IsRTL()*
- *GetFontForText()*
- *GetSystemLocale()*
- *IsSystemLocaleRTL()*

### 11.6.1 CopyToClipboard()

*Puts argument in system clipboard.*

#### Description:

Puts text into the the system clipboard, so that it can be accessed either by another program or by the `Copyfromclipboard` function. Note that, possibly depending on platform, text copied into the clipboard by PEBL may not stay there after PEBL exits.

#### Example:

```
text <- GetInput(textbox,"<enter>")
CopyToClipboard(text)
MessageBox("Text : " + text + " copied to clipboard",gWin)
```

See Also:

CopyFromClipboard()

### 11.6.2 FindInString()

**Description:**

Finds a token in a string, returning the position (starting at a particular position).

**Usage:**

```
FindInString(<basestring>,<searchstring>,<startingpos>)
```

**Example:**

```
FindInString("about","bo",1)      # == 2
FindInString("banana","na",1)     # == 3
FindInString("banana","na",4)     # == 5
```

See Also:

SplitString()

### 11.6.3 Format()

**Description:**

Formats the printing of values to ensure proper spacing. It will either truncate or pad <value> with spaces so that it ends up exactly <length> characters long. Character padding is at the end.

**Usage:**

```
Format(<value>,<length>)
```

**Example:**

```
x <- 33.23425225
y <- 23.3
Print("["+Format(x,5)+"] ")
Print("["+Format(y,5)+"] ")
## Output:
## [33.23 ]
## [23.3  ]
```

**See Also:**

`CR()`, `Tab()`

### 11.6.4 Lowercase()

*Returns lowercased string*

**Description:**

Changes a string to lowercase. Useful for testing user input against a stored value, to ensure case differences are not detected.

**Usage:**

```
Lowercase(<string>)
```

**Example:**

```
Lowercase("POtaTo") # == "potato"
```

**See Also:**

`Uppercase()`

### 11.6.5 SplitString()

**Description:**

Splits a string into tokens. `<split>` must be a string. If `<split>` is not found in `<string>`, a list containing the entire string is returned; if `split` is equal to `" "`, the each letter in the string is placed into a different item in the list. Only the first character of `<split>` is used. IF you need a multicharacter split, you can use `<SplitStringSlow>`, which can handle multi-character splits but is relatively slower. This should not matter for short strings, but if you are using `splitstring` on long files, it could make a difference.

**Usage:**

```
SplitString(<string>, <split>)
```

**Example:**

```
SplitString("Everybody Loves a Clown", " ")  
# Produces ["Everybody", "Loves", "a", "Clown"]
```

**See Also:**

`FindInString()`, `ReplaceChar()`, `SplitStringSlow()`

### 11.6.6 StringLength()

*Returns the length of a string*

**Description:**

Determines the length of a string, in characters.

**Usage:**

```
StringLength(<string>)
```

**Example:**

```
StringLength("absolute")      # == 8
StringLength("  spaces  ")    # == 12
StringLength("")              # == 0
```

**See Also:**

Length(), SubString()

### 11.6.7 SubString()

*Returns a substring*

**Description:**

Extracts a substring from a longer string.

**Usage:**

```
SubString(<string>,<position>,<length>)
```

**Example:**

```
SubString("abcdefghijklmnop",3,5)  # == "cdefg"
```

**See Also:**

StringLength(), FindInString()

### 11.6.8 ToASCII()

*Converts an ASCII code to a character*

**Description:**

Converts an integer ASCII code to its corresponding single-character string. This is useful for creating special characters or control characters from their numeric codes.

**Usage:**

```
ToASCII(<ascii_code>)
```

**Example:**

```
ToASCII(65)    # == "A"
ToASCII(97)    # == "a"
ToASCII(32)    # == " " (space)
ToASCII(10)    # == newline character
```

**See Also:**

StringLength(), Uppercase(), Lowercase()

### 11.6.9 Uppercase()

*Returns uppercased string*

**Description:**

Changes a string to uppercase. Useful for testing user input against a stored value, to ensure case differences are not detected.

**Usage:**

```
Uppercase(<string>)
```

**Example:**

```
Uppercase("POtaTo") # == "POTATO"
```

**See Also:**

Lowercase()

### 11.6.10 DetectTextScript()

*Detects the Unicode script of text*

#### Description:

Analyzes text and returns the ISO 15924 four-letter script code identifying the writing system used. Returns codes such as “Arab” (Arabic), “Hebr” (Hebrew), “Hani” (Han/Chinese), “Thai” (Thai), “Cyril” (Cyrillic), etc. Returns an empty string for Latin script or when the script cannot be determined. This is useful for automatic font selection, determining text directionality, and providing appropriate text rendering for international content.

#### Usage:

```
DetectTextScript(<text>)
```

#### Example:

```
## Detect scripts in different languages
Print(DetectTextScript("Hello"))           ## "" (Latin)
## Arabic text "marhaba" (hello):
Print(DetectTextScript(arabicText))        ## "Arab" (Arabic)
## Hebrew text "shalom" (hello):
Print(DetectTextScript(hebrewText))        ## "Hebr" (Hebrew)
## Chinese text "nihao" (hello):
Print(DetectTextScript(chineseText))       ## "Hani" (Chinese)
## Thai text "sawasdee" (hello):
Print(DetectTextScript(thaiText))          ## "Thai" (Thai)
## Cyrillic text "privet" (hello):
Print(DetectTextScript(cyrillicText))      ## "Cyril" (Cyrillic)
```

#### See Also:

IsRTL(), GetFontForText(), GetSystemLocale()

### 11.6.11 IsRTL()

*Determines if text or script is right-to-left*

#### Description:

Tests whether the input is right-to-left (RTL) text. The function accepts either actual text (which will be analyzed to detect its script) or a four-letter ISO 15924 script code. Returns 1 for RTL scripts (Arabic, Hebrew, etc.) and 0 for LTR scripts. This is essential for proper text layout, UI mirroring, and ensuring correct text directionality in international experiments.

#### Usage:

```
IsRTL(<text_or_script_code>)
```

**Example:**

```
## Test with actual text
Print(IsRTL("Hello"))                ## 0 (LTR)
## Arabic text "marhaba":
Print(IsRTL(arabicText))             ## 1 (RTL - Arabic)
## Hebrew text "shalom":
Print(IsRTL(hebrewText))             ## 1 (RTL - Hebrew)

## Test with script codes
Print(IsRTL("Arab"))                 ## 1 (Arabic script is RTL)
Print(IsRTL("Hebr"))                 ## 1 (Hebrew script is RTL)
Print(IsRTL("Latn"))                 ## 0 (Latin script is LTR)

## Use for text justification
text <- GetInput(textbox, "<return>")
if(IsRTL(text))
{
    textbox.hjustify <- "right"
}
```

**See Also:**

DetectTextScript(), IsSystemLocaleRTL(), GetFontForText()

### 11.6.12 GetFontForText()

*Returns appropriate font filename for text based on detected script*

**Description:**

Automatically selects an appropriate font for the given text by detecting its Unicode script. This ensures proper rendering of international text by choosing fonts that support the necessary character ranges. The optional `font_type` parameter specifies the font style: 0 for sans-serif (default), 1 for monospace, or 2 for serif. Returns a font filename suitable for use with `MakeFont()`. The function uses the DejaVu and Noto font families which provide extensive Unicode coverage.

**Usage:**

```
GetFontForText(<text>)
GetFontForText(<text>, <font_type>)
```

**Example:**

```
## Automatic font selection for different languages
## arabicText would contain Arabic text "marhaba bik"
fontFile <- GetFontForText(arabicText)
font <- MakeFont(fontFile, 0, 24, MakeColor("black"), MakeColor(
  ↪ "white"), 1)
label <- MakeLabel(arabicText, font)

## Select monospace font for code display
## hebrewCode would contain Hebrew text
monoFont <- GetFontForText(hebrewCode, 1) ## 1 = monospace

## Select serif font for Thai text
## thaiText would contain Thai text "sawasdee"
serifFont <- GetFontForText(thaiText, 2) ## 2 = serif
```

See Also:

DetectTextScript(), MakeFont(), IsRTL()

### 11.6.13 GetSystemLocale()

*Retrieves the operating system's locale setting*

#### Description:

Returns the current system locale as configured in the operating system. The locale string typically follows the format “language\_COUNTRY” (e.g., “en\_US”, “zh\_CN”, “ar\_SA”) or may be just a language code (e.g., “ar”, “he”). Returns an empty string if locale detection fails. This is useful for automatically adapting experiment interfaces to the user’s language and regional settings.

#### Usage:

```
GetSystemLocale()
```

#### Example:

```
## Detect system locale and adapt interface
locale <- GetSystemLocale()
Print("System locale: " + locale)

if(SubString(locale, 1, 2) == "ar")
{
  ## Arabic locale detected
  gLanguage <- "ar"
} elseif(SubString(locale, 1, 2) == "he")
```

(continues on next page)

(continued from previous page)

```
{
  ## Hebrew locale detected
  gLanguage <- "he"
} else {
  ## Default to English
  gLanguage <- "en"
}

## Possible outputs: "en_US", "ar_SA", "he_IL", "zh_CN", "es_MX",
→ etc.
```

**See Also:**

IsSystemLocaleRTL(), DetectTextScript(), GetFontForText()

### 11.6.14 IsSystemLocaleRTL()

*Checks if the system locale uses right-to-left text*

**Description:**

Determines whether the operating system's current locale setting is for a right-to-left (RTL) language (Arabic or Hebrew). Returns 1 if the system locale is RTL, 0 if it is LTR. This is particularly useful for setting default text justification and UI layout before any text input occurs, ensuring that the interface matches the user's language expectations.

**Usage:**

```
IsSystemLocaleRTL()
```

**Example:**

```
## Set default text justification based on system locale
if(IsSystemLocaleRTL())
{
  ## System is configured for RTL language (Arabic/Hebrew)
  defaultJustify <- "right"
  Print("RTL locale detected")
} else {
  ## System is configured for LTR language
  defaultJustify <- "left"
  Print("LTR locale detected")
}
```

(continues on next page)

(continued from previous page)

```
## Create textbox with appropriate default alignment
textbox <- MakeTextBox("", font, 400, 100)
textbox.hjustify <- defaultJustify
```

**See Also:**

GetSystemLocale(), IsRTL(), DetectTextScript()

## 11.7 Design Library - Experimental Design

This library contains functions for experimental design, including Latin squares, counterbalancing, and design matrices.

### Function Index

- *ChooseN()*
- *DesignBalancedSampling()*
- *DesignGrecoLatinSquare()*
- *DesignLatinSquare()*
- *ExtractListItems()*
- *Flatten()*
- *FlattenN()*
- *FoldList()*
- *Insert()*
- *LatinSquare()*
- *Levels()*
- *ListBy()*
- *RemoveSubset()*
- *Replace()*
- *Rest()*
- *Sample()*
- *SampleN()*
- *SampleNWithReplacement()*

- *ShuffleRepeat()*
- *ShuffleWithoutAdjacents()*
- *Subset()*
- *Functions Pending Documentation*
- *FindToken()*
- *Reverse()*

### 11.7.1 ChooseN()

**Description:**

Samples <number> items from list, returning a list in the original order. Items are sampled without replacement, so once an item is chosen it will not be chosen again. If <number> is larger than the length of the list, the entire list is returned in order. It differs from `SampleN` in that `ChooseN` returns items in the order they appeared in the original list, but `SampleN` is shuffled.

**Usage:**

```
define ChooseN(...)
```

**Example:**

```
# Returns 5 numbers
ChooseN([1,1,1,2,2], 5)

# Returns 3 numbers from 1 and 7:
ChooseN([1,2,3,4,5,6,7], 3)
```

**See Also:**

`SampleN()`, `SampleNWithReplacement()`, `Subset()`

### 11.7.2 DesignBalancedSampling()

**Description:**

Samples elements roughly'' equally. This function returns a list of repeated samples from ``<treatment\_list>, such that each element in <treatment\_list> appears approximately equally. Each element from <treatment\_list> is sampled once without replacement before all elements are returned to the mix and sampling is repeated. If there are no repeated items in <list>, there will be no consecutive repeats in the output. The last

repeat-sampling will be truncated so that a `<length>`-size list is returned. If you don't want the repeated epochs this function provides, `Shuffle()` the results.

**Usage:**

```
define DesignBalancedSampling(...)
```

**Example:**

```
DesignBalancedSampling([1,2,3,4,5],12)
## e.g., produces something like:
##      [5,3,1,4,2, 3,1,5,2,4, 3,1 ]
```

**See Also:**

```
CrossFactorWithoutDuplicates(),
      Shuffle(), DesignFullCounterBalance(),
      DesignGrecoLatinSquare(), DesignLatinSquare(), Repeat(),
      RepeatList(), LatinSquare()
```

### 11.7.3 DesignGrecoLatinSquare()

**Description:**

This will return a list of lists formed by rotating through each element of the `<treatment_list>` s, making a list containing all element of the list, according to a greco-latin square. All lists must be of the same length.

**Usage:**

```
define DesignGrecoLatinSquare(...)
```

**Example:**

```
x <- ["a","b","c"]
y <- ["p","q","r"]
z <- ["x","y","z"]
Print(DesignGrecoLatinSquare(x,y,z))
# produces:      [[a, p, x], [b, q, y], [c, r, z]],
#               [[a, q, z], [b, r, x], [c, p, y]],
#               [[a, r, y], [b, p, z], [c, q, x]]]
```

**See Also:**

```
CrossFactorWithoutDuplicates(), LatinSquare(),
DesignFullCounterBalance(), DesignBalancedSampling(),
DesignLatinSquare(), Repeat(), RepeatList(),
      Shuffle()
```

### 11.7.4 DesignLatinSquare()

*Simple latin square*

**Description:**

This returns a list of lists formed by rotating through each element of <treatment\_list>, making a list containing all element of the list. Has no side effect on input lists.

**Usage:**

```
define DesignLatinSquare(...)
```

**Example:**

```
order <- [1,2,3]
treatment <- ["A","B","C"]
design <- DesignLatinSquare(order,treatment)
# produces: [[[1, A], [2, B], [3, C]],
#           [[1, B], [2, C], [3, A]],
#           [[1, C], [2, A], [3, B]]]
```

**See Also:**

```
CrossFactorWithoutDuplicates(),
  DesignFullCounterBalance(),      DesignBalancedSampling(),
  DesignGrecoLatinSquare(), Repeat(), LatinSquare() RepeatList(),
  Shuffle(), Rotate()
```

### 11.7.5 ExtractListItems()

*Gets a subset of items from a list*

**Description:**

Extracts items from a list, forming a new list. The list <items> are the integers representing the indices that should be extracted.

**Usage:**

```
define ExtractListItems(...)
```

**Example:**

```
myList <- Sequence(101, 110, 1)
ExtractListItems(myList, [2,4,5,1,4])
# produces [102, 104, 105, 101, 104]
```

**See Also:**

Subset(), SubList(), SampleN(), Filter()

### 11.7.6 Flatten()

*Flattens a nested list completely*

**Description:**

Flattens nested list <list> to a single flat list.

**Usage:**

```
define Flatten(...)
```

**Example:**

```
Flatten([1,2,[3,4],[5,[6,7],8],[9]]) # == [1,2,3,4,5,6,7,8,9]
Flatten([1,2,[3,4],[5,[6,7],8],[9]]) # == [1,2,3,4,5,6,7,8,9]
```

**See Also:**

FlattenN(), FoldList()

### 11.7.7 FlattenN()

*Flattens n levels of a nested list*

**Description:**

Flattens <n> levels of nested list <list>.

**Usage:**

```
define FlattenN(...)
```

**Example:**

```
Flatten([1,2,[3,4],[5,[6,7],8],[9]],1)
# == [1,2,3,4,5,[6,7],8,9]
```

**See Also:**

Flatten(), FoldList()

### 11.7.8 FoldList()

*Folds list into length-n sublists.*

**Description:**

Folds a list into equal-length sublists.

**Usage:**

```
define FoldList(...)
```

**Example:**

```
FoldList([1,2,3,4,5,6,7,8],2)      # == [[1,2],[3,4],[5,6],[7,
↪8]]
```

**See Also:**

FlattenN(), Flatten()

### 11.7.9 Insert()

**Description:**

Inserts an element into a list at a specified position, returning the new list. The original list is unchanged.

**Usage:**

```
define Insert(...)
```

**Example:**

```
x <- [1,2,3,5]
y <- Insert(x,1,4)
##y== [1,2,3,1,5]
```

**See Also:**

List(), Merge, Append

### 11.7.10 LatinSquare()

*A simple latin square constructor*

**Description:**

Quick and dirty latin square, taking on just one list argument.

**Usage:**

```
define LatinSquare(...)
```

**Example:**

```
Print(LatinSquare([11,12,13,14,15,16]))
# Output:
#[[11, 12, 13, 14, 15, 16]
#, [12, 13, 14, 15, 16, 11]
#, [13, 14, 15, 16, 11, 12]
#, [14, 15, 16, 11, 12, 13]
#, [15, 16, 11, 12, 13, 14]
#, [16, 11, 12, 13, 14, 15]
#]
```

DesignFullCounterBalance(),
    DesignBalancedSampling(),          DesignGrecoLatinSquare(),
    DesignLatinSquare(), Repeat(), RepeatList(), Shuffle()
```

### 11.7.11 Levels()

*Returns a sorted list of unique elements in list.*

**Description:**

Returns sorted list of unique elements of a list.

**Usage:**

```
define Levels(...)
```

**Example:**

```
Levels([1,3,55,1,5,1,5])    # == [1,3,5,55]
```

**See Also:**

```
Match(), Filter(), Sort()
```

### 11.7.12 ListBy()

*Segments a list into sublist by the values of a second list*

**Description:**

organizes a list into sublists, based on the elements of a second list. It returns a list of two entities: (1) a condition list, describing what values were aggregated across; (2) the nested list elements. The length of each element should be the same. Together with Match and Filter, ListBy is useful for aggregating data across blocks and conditions for immediate feedback.

**Usage:**

```
define ListBy(...)
```

**Example:**

```
a <- Sequence(1,10,1)
b <- RepeatList([1,2],5)
x <- ListBy(a,b)
Print(x)
#[[1, 2],
#  [[1, 3, 5, 7, 9],
#   [2, 4, 6, 8, 10]]
#]

Print(ListBy(b,a))
#[[1, 2, 3, 4, 5, 6, 7, 8, 9, 10],
#  [[1], [2], [1], [2], [1], [2], [1], [2], [1], [2]]]
```

**See Also:**

List(), [ ], Merge(), Append()

### 11.7.13 RemoveSubset()

**Description:**

Removes a subset of elements from a list. Creates a new list, and does not affect the original

**Usage:**

```
define RemoveSubset(...)
```

**Example:**

```
list1 <- [1,2,2,4,5]
list2 <- RemoveSubset(list1,[2,3])
Print(list1) #[1,2,2,4,5]
Print(list2) #[1,4,5]
```

**See Also:**

Merge(), Insert(), Rest()

### 11.7.14 Replace()

*Replaces items in a data structure*

**Description:**

Creates a copy of a (possibly nested) list in which items matching some list are replaced for other items. <template> can be any data structure, and can be nested. <replacementList> is a list containing two-item list pairs: the to-be-replaced item and to what it should be transformed. Note: replacement searches the entire <replacementList> for matches. If multiple keys are identical, the item will be replaced with the last item that matches.

**Usage:**

```
define Replace(...)
```

**Example:**

```
x <- ["a","b","c","x"]
rep <- [{"a","A"}, {"b","B"}, {"x","D"}]
Print(Replace(x,rep))
# Result: [A, B, c, D]
```

**See Also:**

ReplaceChar()

### 11.7.15 Rest()

*Returns a list minus its first element*

**Description:**

Returns the ‘rest’ of a list; a list minus its first element. If the list is empty or has a single member, it will return an empty list []. This is a very common function in LISP.

**Usage:**

```
define Rest(...)
```

**Example:**

```
x <- Sequence(1,5,1)
y <- Rest(x)
Print(rep)
# Result: [2,3,4,5]
```

**See Also:**

Insert()

### 11.7.16 Sample()

**Description:**

Samples a single item from a list, returning it. It is a bit more convenient at times than ShuffleN(list,1), which returns a list of length 1. Implemented as First(ShuffleN(list,1))

**Usage:**

```
define Sample(...)
```

**Example:**

```
Sample([1,1,1,2,2]) # Returns a single number
Sample([1,2,3,4,5,6,7]) # Returns a single number
```

**See Also:**

SeedRNG(), Sample(), ChooseN(), SampleNWithReplacement(), Subset()

### 11.7.17 SampleN()

**Description:**

Samples <number> items from list, returning a randomly- ordered list. Items are sampled without replacement, so once an item is chosen it will not be chosen again. If <number> is larger than the length of the list, the entire list is returned shuffled. It differs from ChooseN in that ChooseN returns items in the order they appeared in the original list. It is implemented as Shuffle(ChooseN()).

**Usage:**

```
define SampleN(...)
```

**Example:**

```
SampleN([1,1,1,2,2], 5)      # Returns 5 numbers  
SampleN([1,2,3,4,5,6,7], 3) # Returns 3 numbers
```

**See Also:**

ChooseN(), SampleNWithReplacement(), Subset()

### 11.7.18 SampleNWithReplacement()

**Description:**

SampleNWithReplacement samples <number> items from <list>, replacing after each draw so that items can be sampled again. <number> can be larger than the length of the list. It has no side effects on its arguments.

**Usage:**

```
define SampleNWithReplacement(...)
```

**Example:**

```
x <- Sequence(1:100,1)  
SampleNWithReplacement(x, 10)  
# Produces 10 numbers between 1 and 100, possibly  
# repeating some.
```

**See Also:**

SampleN(), ChooseN(), Subset()

### 11.7.19 ShuffleRepeat()

**Description:**

Randomly shuffles <list>, repeating <n> times. Shuffles each iteration of the list separately, so you are guaranteed to go through all elements of the list before you get another. Returns a nested list.

**Usage:**

```
define ShuffleRepeat(...)
```

**Example:**

```
Print(ShuffleRepeat([1,2,3,4,5]),3)
## Results might be anything, like:
## [[5,3,2,1,4], [3,2,5,1,4], [1,4,5,3,2]]
```

Typically, you will want to flatten before using:

```
list <- Flatten(ShuffleRepeat([1,2,3], 5))
```

See Also:

Sort(), SortBy(), ShuffleRepeat(),  
ShuffleWithoutAdjacents()

### 11.7.20 ShuffleWithoutAdjacents()

#### Description:

Randomly shuffles <nested-list>, attempting to create a list where the nested elements do not appear adjacently in the new list. Returns a list that is flattened one level. It will always return a shuffled list, but it is not guaranteed to return one that has the non-adjacent structure specified, because this is sometimes impossible or very difficult to do randomly. Given small enough non-adjacent constraints with enough fillers, it should be able to find something satisfactory.

#### Usage:

```
define ShuffleWithoutAdjacents(...)
```

#### Example:

```
Print(ShuffleWithoutAdjacents([[1,2,3],
                              [4,5,6],
                              [7,8,9]]))

## Example Output:
## [8, 5, 2, 7, 4, 1, 6, 9, 3]
## [7, 4, 8, 1, 9, 2, 5, 3, 6]

## Non-nested items are shuffled without constraint
Print(ShuffleWithoutAdjacents([[1,2,3],
                              11,12,13,14,15,16]]))

## output: [13, 11, 2, 14, 3, 15, 1, 16, 12]
##         [13, 12, 2, 16, 15, 11, 1, 14, 3]
##         [11, 1, 15, 2, 12, 16, 14, 13, 3]
```

(continues on next page)

(continued from previous page)

```
## Sometimes the constraints cannot be satisfied.
## 9 will always appear in position 2
Print(ShuffleWithoutAdjacents([[1,2,3], 9])
## output: [3, 9, 1, 2]
##         [2, 9, 3, 1]
##         [3, 9, 2, 1]
```

**See Also:**

Shuffle(), Sort(), SortBy(),  
ShuffleRepeat(), ShuffleWithoutAdjacents()

**11.7.21 Subset()**

*returns a subset of items from a list*

**Description:**

Extracts a subset of items from another list, returning a new list that includes items from the original list only once and in their original orders. Item indices in the second argument that do not exist in the first argument are ignored. It has no side effects on its arguments.

**Usage:**

```
define Subset(...)
```

**Example:**

```
Subset([1,2,3,4,5,6], [5,3,1,1])      # == [1,3,5]
Subset([1,2,3,4,5], [23,4,2])        # == [2,4]
```

**See Also:**

SubList(), ExtractItems(), SampleN()

**11.7.22 Functions Pending Documentation****11.7.23 FindToken()**

*Recursively searches for a token in a nested list structure*

**Description:**

Searches recursively through a possibly nested list to find a specific token (value). Returns the index (1-based) of the first occurrence of the token found. If the

token is in a nested sublist, it searches that sublist recursively. Returns 0 if the token is not found. Useful for searching complex nested data structures.

**Usage:**

```
define FindToken(token, nestedlist)
```

**Example:**

```
# Search in a flat list
data <- ["apple", "banana", "cherry"]
index <- FindToken("banana", data)
Print(index)
# Result: 2

# Search in nested list
nested <- [["a", "b"], ["c", "d"], ["e", "f"]]
index <- FindToken("d", nested)
Print(index)
# Result: 2 (found in second sublist)

# Token not found
index <- FindToken("z", data)
Print(index)
# Result: 0
```

**See Also:**

IsMember(), Match(), Filter()

### 11.7.24 Reverse()

*Reverses the order of elements in a list*

**Description:**

Returns a new list containing all elements from the input list in reverse order. The original list is unchanged. This function is useful for reversing presentation order, creating backwards sequences, or implementing stack-like data structures.

**Usage:**

```
define Reverse(list)
```

**Example:**

```
x <- [1, 2, 3, 4, 5]
y <- Reverse(x)
Print(y)
# Result: [5, 4, 3, 2, 1]

words <- ["first", "second", "third"]
Print(Reverse(words))
# Result: [third, second, first]
```

- *ThickLine2()*

### 11.8.1 BlockE()

*Creates a block E as a useable polygon which can be added to a window directly.*

**Description:**

Creates a polygon in the shape of a block E, pointing in one of four directions. Arguments include position in window.

- `<x>` and `<y>` is the position of the center
- `<h>` and `<w>` or the size of the E in pixels
- `<thickness>` thickness of the E
- `<direction>` specifies which way the E points: 1=right, 2=down, 3=left, 4=up.
- `<color>` is a color object (not just the name)

Like other drawn objects, the Block E must then be added to the window to appear.

**Usage:**

```
define BlockE(...)
```

**Example:**

```
win <- MakeWindow()
e1 <- BlockE(100,100,40,80,10,1,MakeColor("black"))
AddObject(e1,win)
Draw()
```

**See Also:**

Plus(), Polygon(), MakeStarPoints(), MakeNGonPoints()

**11.8.2 ConvexHull()**

*Returns a convex subset of points for a set*

**Description:**

Computes the convex hull of a set of [x,y] points. It returns a set of points that forms the convex hull, with the first and last point identical. A convex hull is the set of outermost points, such that a polygon connecting just those points will encompass all other points, and such that no angle is acute. It is used in MakeAttneave.

**Usage:**

```
define ConvexHull(...)
```

**Example:**

```
pts <- [[0.579081, 0.0327737],
        [0.0536094, 0.378258],
        [0.239628, 0.187751],
        [0.940625, 0.26526],
        [0.508748, 0.840846],
        [0.352604, 0.200193],
        [0.38684, 0.212413],
        [0.00114761, 0.768165],
        [0.432963, 0.629412]]
Print(ConvexHull(pts))
```

output:

```
[[0.940625, 0.26526]
 , [0.508748, 0.840846]
```

(continues on next page)

(continued from previous page)

```
, [0.00114761, 0.768165]
, [0.0536094, 0.378258]
, [0.239628, 0.187751]
, [0.579081, 0.0327737]
, [0.940625, 0.26526]
```

**See Also:**

MakeAttneave,

### 11.8.3 GetAngle()

*Returns the angle in degrees of a vector.*

**Description:**

Gets an angle (in degrees) from (0,0) of an x,y coordinate

**Usage:**

```
define GetAngle(...)
```

**Example:**

```
##point sprite in the direction of a click
sprite <- LoadImage("car.png")
AddObject(sprite,gWin)
Move(sprite,300,300)
xy <- WaitForDownClick()
newangle <- GetAngle(First(xy)-300,Second(xy)-300)
sprite.rotation <- newangle
Draw()
```

**See Also:**

DegtoRad, RadToDeg

### 11.8.4 GetAngle3()

*Gets angle abc.*

**Description:**

Gets an angle (in radians) of abc.

**Usage:**

```
define GetAngle3(...)
```

**Example:**

```
a <- [0.579081, 0.0327737]
b <- [0.0536094, 0.378258]
c <- [0.239628, 0.187751]

Print(GetAngle3(a,b,c)) ## .2157
```

**See Also:**

DegtoRad, RadToDeg, GetAngle, ToRight

### 11.8.5 KaniszaPolygon()

**Description:**

Creates generic polygon, defined only by with pac-man circles at specified vertices.

**Usage:**

```
define KaniszaPolygon(...)
```

**Example:**

For detailed usage example, see: <http://peblblog.blogspot.com/2010/11/kanizsa-shapes.html>

Part of a script using KaniszaPolygon:

```
#Specify the xy points
xys <- [[10,10],[10,50],[130,60],[100,100],[150,100],
        [150,20],[80,-10],[45,10]]

#Specify which vertices to show (do all)
show <- [1,1,1,1,1,1,1,1]

#Make one, showing the line
x <- KaniszaPolygon(xys,show,10,fg,bg,1)
AddObject(x,gWin); Move(x,200,200)

#Make a second, not showing the line
x2 <- KaniszaPolygon(xys,show,10,fg,bg,0)
AddObject(x2,gWin); Move(x2,400,200)
```

(continues on next page)

(continued from previous page)

```
#Make a third, only showing some vertices:
x3 <- KaniszaPolygon(xys, [1,1,1,1,1,0,0,1], 10, fg, bg, 0)
AddObject(x3, gWin); Move(x3, 600, 200)
```

**See Also:**

Polygon(), KaneszaSquare()

### 11.8.6 KaniszaSquare()

**Description:**

Creates generic Kanesza Square, one defined only by with **pac-man** circles at its vertices:

**Usage:**

```
define KaniszaSquare(...)
```

**Example:**

```
For detailed usage example, see
`http://peblblog.blogspot.com/2010/11/kanizsa-shapes.html`
```

```
gWin <- MakeWindow()
square <- KaniszaSquare(150, 20, MakeColor("red"),
                        MakeColor("green"))

AddObject(square, gWin)
Move(square, 200, 200)
Draw()
WaitForAnyKeyPress()
```

**See Also:**

Polygon(), KaneszaPolygon()

### 11.8.7 LayoutGrid()

*Creates [x,y] pairs in a grid for graphical layout*

#### Description:

Creates a grid of x,y points in a range, that are spaced in a specified number of rows and columns. Furthermore, you can specify whether they are vertical or horizontally laid out.

#### Usage:

```
define LayoutGrid(...)
```

#### Example:

Example PEBL Program using NonoverlapLayout:

```
define Start(p)
{
  gWin <- MakeWindow()
  gVideoWidth <- 800
  gVideoHeight <- 300

  lab1 <- EasyLabel("LayoutGrid, horizontal",
                    200,25,gWin,24)
  lab2 <- EasyLabel("LayoutGrid, vertical",
                    600,25,gWin,24)
  nums <- Sequence(1,20,1)
  stim1 <- []
  stim2 <- []

  font <- MakeFont(gPebLBaseFont,0,25,
                  MakeColor("black"),MakeColor("white"),0)
  loop(i,nums)
  {
    stim1 <- Append(stim1,MakeLabel(i+"",font))
    stim2 <- Append(stim2,MakeLabel(i+"",font))
  }

  layout1 <- LayoutGrid(50,gVideoWidth/2-50,
                        50,gVideoHeight-50,5,4,0)
  layout2 <- LayoutGrid(gVideoWidth/2+50,gVideoWidth-50,
                        50,gVideoHeight-50,5,4,1)

  ##Now, layout the stuff.
```

(continues on next page)

(continued from previous page)

```

loop(i,Transpose([stim1,layout1]))
{
  obj <- First(i)
  xy <- Second(i)
  AddObject(obj,gWin)
  Move(obj, First(xy),Second(xy))
}

loop(i,Transpose([stim2,layout2]))
{
  obj <- First(i)
  xy <- Second(i)
  AddObject(obj,gWin)
  Move(obj, First(xy),Second(xy))
}

Draw()
WaitForAnyKeyPress()
}

```

The output of the above program is shown below. Even for the left configuration, which is too compact (and which takes a couple seconds to run), the targets are fairly well distributed.

See Also:

NonOverlapLayout()

### 11.8.8 MakeAttneave()

*Makes a complex ``Attneave'' polygon*

#### Description:

Makes a random 'Attneave' figure((Collin, C. A., & McMullen, P. A. (2002). Using Matlab to generate families of similar Attneave shapes. Behavior Research Methods Instruments and Computers, 34(1), 55-68.)). An Attneave figure is a complex polygon that can be used as a stimulus in a number of situations. It returns a sequence of points for use in Polygon(). {} MakeAttneave uses ConvexHull, InsertAttneavePointRandom() and ValidateAttneaveShape(), found in Graphics.pbl. Override these to change constraints such as minimum/maximum side lengths, angles, complexity, etc. MakeAttneave uses a

sampling-and-rejection scheme to create in-bounds shapes. Thus, if you specify impossible or nearly-impossible constraints, the time necessary to create shapes may be very long or infinite. The arguments to `MakeAttneave` are:

- `size`: size, in pixels, of a circle from which points are sampled in a uniform distribution.
- `numpoints`: number of points in the polygon.
- `minangle`: smallest angle acceptable (in degrees).
- `maxangle`: largest angle acceptable (in degrees).

**Usage:**

```
define MakeAttneave(...)
```

**Example:**

```
gWin <- MakeWindow()
shape <- MakeAttneave(100,5+RandomDiscrete(5),5,170)
pts <- Transpose(shape)
poly <- Polygon(200,200,First(pts),Second(pts),
               MakeColor("blue"),1)
AddObject(poly,gWin)
Draw()
WaitForAnyKeyPress()
```

**See Also:**

`MakeImage()`, `Polygon()`, `Square()`

### 11.8.9 MakeGabor()

*Creates a ‘gabor patch’ with specified parameters*

**Description:**

Creates a greyscale gabor patch, with seven variables:

- `size` (in pixels) of square the patch is drawn on
  - `freq`: frequency of grating (number of wavelengths in size)
  - `sd`: standard deviation, in pixels, of gaussian window
  - `angle`: angle of rotation of grating, in radians
  - `phase`: phase offset of grating (in radians)
  - `bglev`: number between 0 and 255 indicating background color in greyscale.
- { }

Usage:

```
define MakeGabor(...)
```

Example:

```
win <- MakeWindow()
patch <- MakeGabor(80, 0,10,0,0,100)
AddObject(patch,win)
Move(patch,200,200)
Draw()
```

See Also:

MakeAttneave(), SetPixel(), MakeCanvas()

### 11.8.10 MakeGraph()

Description:

Creates a simple bargraph that can be added to/moved on a window..

Usage:

```
define MakeGraph(...)
```

### 11.8.11 MakeNGonPoints()

*Creates points for a polygon, which can then be fed to Polygon*

Description:

Creates a set of points that form a regular n-gon. It can be transformed with functions like `RotatePoints`, or it can be used to create a graphical object with `Polygon`. Note: `MakeNGonPoints` returns a list like:

```
[[x1, x2, x3,...],[y1,y2,y3,...]],
while Polygon() takes the X and Y lists independently.
```

Usage:

```
define MakeNGonPoints(...)
```

Example:

```
window <- MakeWindow()
ngonp <- MakeNGonPoints(50,10)
ngon <- Polygon(200,200,First(ngonp),Nth(ngonp,2),
               MakeColor("red"),1)
AddObject(ngon>window)
Draw()
```

**See Also:**

MakeStarPoints, Polygon, RotatePoints, ZoomPoints

### 11.8.12 MakeStarPoints()

*Creates points for a star, which can then be fed to Polygon*

**Description:**

Creates a set of points that form a regular star. It can be transformed with functions like RotatePoints, or it can be used to create a graphical object with Polygon. Note: MakeStarPoints returns a list:

```
[[x1, x2, x3,...],[y1,y2,y3,...]],
while ``Polygon()`` takes the X and Y lists independently.
```

**Usage:**

```
define MakeStarPoints(...)
```

**Example:**

```
window <- MakeWindow()
sp <- MakeStarPoints(50,20,10)
star <- Polygon(200,200,First(sp),Nth(sp,2),
               MakeColor("red"),1)
AddObject(star>window)
Draw()
```

**See Also:**

MakeNGonPoints, Polygon, RotatePoints, ZoomPoints

### 11.8.13 NonOverlapLayout()

*Creates a set of num points that don't overlap, but fails gracefully*

#### Description:

Creates a set of num points in a xy range, that have a (soft) minimum tolerance of 'tol' between points. That is, to the extent possible, the returned points will have a minimum distance between them of <tol>. This may not be possible or be very difficult, and so after a limited number of attempts (by default, 100), the algorithm will return the current configuration, which may have some violations of the minimum tolerance rule, but it will usually be fairly good. The algorithm works by initializing with a random set of points, then computing a pairwise distance matrix between all points, finding the closest two points, and resampling one of them until its minimum distance is larger than the current. Thus, each internal iteration uniformly improves (or keeps the configuration the same), and the worst points are reconfigured first, so that even if a configuration that does not satisfy the constraints, it will usually be very close. Internally, the function (located in pebl-lib/Graphics.pbl) has a variable that controls how many steps are taken, called `limit`, which is set to 100. For very compacted or very large iterations, this limit can be increased by editing the file or making a copy of the function. The function usually returns fairly quickly, so it can often be used real-time between trials. However, for complex enough configurations, it can take on the order of seconds; furthermore, more complex configurations might take longer than less complex configurations, which could represent a potential confound (if more complex stimuli have longer ISIs). Users should thus consider creating the configurations when the test is initialized, or created prior to the study and then saved out to a file for later use. newpage

#### Usage:

```
define NonOverlapLayout(...)
```

#### Example:

Example PEBL Program using NonoverlapLayout:

```
define Start(p)
{
  win <- MakeWindow()
  ## Make 25 points in a square in the middle
  ## of the screen, a minimum of 50 pixels apart.
  ## This is too compact, but it will be OK.

  points <- NonOverlapLayout(100,300,200,400,50,25)
  circles <- []
  ##This should non-overlapping circles of radius 25
```

(continues on next page)

(continued from previous page)

```

loop(i,points)
{
  tmp <- Circle(First(i),Second(i),25,
               MakeColor("blue"),0)
  AddObject(tmp,win)
  circs <- Append(circs,tmp)
}

rect1 <- Square(200,300,200,MakeColor("black"),0)
rect2 <- Square(600,300,200,MakeColor("black"),0)

AddObject(rect1,win)
AddObject(rect2,win)
##Reduce the tolerance: this one should be better
points <- NonOverlapLayout(500,700,200,400,50,15)

##This should non-overlapping circles of radius 15
loop(i,points)
{
  tmp <- Circle(First(i),Second(i),
               15,MakeColor("blue"),0)
  AddObject(tmp,win)
  circs <- Append(circs,tmp)
}
Draw()
WaitForAnyKeyPress()
}

```

The output of the above program is shown below. Even for the  
 ↪left configuration, which is too compact (and which takes a  
 ↪couple seconds to run), the targets are fairly well  
 ↪distributed.

LayoutGrid()

### 11.8.14 Plus()

*Creates a plus sign as a useable polygon which can be added to a window directly.*

**Description:**

Creates a polygon in the shape of a plus sign. Arguments include position in window.

- <x> and <y> is the position of the center
- <size> or the size of the plus sign in pixels
- <width> thickness of the plus
- <color> is a color object (not just the name)

Like other drawn objects, the plus must then be added to the window to appear.

**Usage:**

```
define Plus(...)
```

**Example:**

```
win <- MakeWindow()
p1 <- Plus(100,100,80,15,MakeColor("red"))
AddObject(p1,win)
Draw()
```

**See Also:**

BlockE(), Polygon(), MakeStarPoints(), MakeNGonPoints()

### 11.8.15 ReflectPoints()

*Reflects points on vertical axis*

**Description:**

Takes a set of points (defined in a joined list `[[x1,x2,x3,...],[y1,y2,y3,...]]` and reflects them around the vertical axis `x=0`, returning a similar `[[x],[y]]` list. Identical to `ZoomPoints(pts,-1,1)`

**Usage:**

```
define ReflectPoints(...)
```

**Example:**

```
points <- [[1,2,3,4],[20,21,22,23]]
newpoints <- ReflectPoints(points)
```

**See Also:**

ZoomPoints(), RotatePoints()

### 11.8.16 ResetCanvas()

*Resets a canvas to its background, erasing anything drawn on the canvas*

**Description:**

Resets a canvas, so that anything drawn onto it is erased and returned to its background color. Implemented by resetting the background color to itself:

```
canvas.color <- canvas.
```

The function does not return the canvas, but has the side effect of resetting it.

**Usage:**

```
define ResetCanvas(...)
```

**Example:**

```
#create a canvas, add pixel noise, then reset and repeat.
define Start(p)
{
  gWin <- MakeWindow()
  canvas <- MakeCanvas(100,100,MakeColor("black"))
  AddObject(canvas,gWin); Move(canvas,300,300)
  Draw()
  white <- MakeColor("white")
  ##add pixel noise
  j <- 1
  while(j < 5)
  {
    i <- 1
    while(i < 200)
    {
      SetPixel(canvas,Round(Random()*100),
               Round(Random()*100),white)
      i <- i +1
    }
  }
}
```

(continues on next page)

(continued from previous page)

```
}  
Draw()  
WaitForAnyKeyPress()  
ResetCanvas(canvas)  
Draw()  
j <- j + 1  
}  
WaitForAnyKeyPress()  
}
```

**See Also:**

SetPixel(), MakeCanvas(), Draw()

### 11.8.17 RGBtoHSV()

*Converts a color to HSV triple*

**Description:**

Converts a color object to HSV values. May be useful for computing color-space distances and so on. No HSVtoRGB is currently implemented.

**Usage:**

```
define RGBtoHSV(...)
```

**Example:**

```
x <- RGBtoHSV(MakeColor("red"))
```

**See Also:**

MakeColor(), MakeColorRGB()

### 11.8.18 RotatePoints()

**Description:**

Takes a set of points (defined in a joined list `[[x1,x2,x3,...], [y1,y2,y3,...]]` and rotates them `<angle>` degrees around the point `[0,0]`, returning a similar `[[x],[y]]` list.

**Usage:**

```
define RotatePoints(...)
```

**Example:**

```
points <- [[1,2,3,4],[20,21,22,23]]
newpoints <- RotatePoints(points,10)
```

**See Also:**

ZoomPoints(), ReflectPoints()

### 11.8.19 SegmentsIntersect()

*Determines whether line segment ab intersects cd.*

**Description:**

Determines whether two line segments, defined by four xy point pairs, intersect. Two line segments that share a corner return 0, although they could be considered to intersect. This function is defined in pebl-lib/Graphics.pbl

**Usage:**

```
define SegmentsIntersect(...)
```

**Example:**

```
SegmentsIntersect(1,0,2,0,
                  1,2,2,2) #0

#returns 0, though they share (1,0)
SegmentsIntersect(1,0,2,0,
                  1,0,2,2)
SegmentsIntersect(1,1,3,1,
                  2,2,2,0) #1
```

**See Also:**

GetAngle3, ToRight

### 11.8.20 ToRight()

*Determines whether p3 is to the right of line p1p2*

**Description:**

Determines whether a point p3 is ‘to the right’ of a line segment defined by p1 to p2. Works essentially by computing the determinant.

**Usage:**

```
define ToRight(...)
```

**Example:**

```
a <- [100,0]
b <- [100,100]
c <- [150,50]
ToRight(a,b,c) # returns 1; true
ToRight(b,a,c) # returns 0; false
```

**See Also:**

GetAngle(), GetAngle3(), SegmentsIntersect()

### 11.8.21 ZoomPoints()

*Zooms a set of points in 2 directions*

**Description:**

Takes a set of points (defined in a joined list `[[x1,x2,x3,...],[y1,y2,y3,...]]` and adjusts them in the x and y direction independently, returning a similar `[[x],[y]]` list. Note: The original points should be centered at zero, because the get adjusted relative to zero, not relative to their center.

**Usage:**

```
define ZoomPoints(...)
```

**Example:**

```
points <- [[1,2,3,4],[20,21,22,23]]
newpoints <- ZoomPoints(points,2,.5)
##Produces [[2,4,6,8],[10,11.5,11,11.5]]
```

**See Also:**

RotatePoints(), ReflectPoints()

## 11.8.22 Functions Pending Documentation

### 11.8.23 GetMinDist()

*Finds the minimum distance between any two points in a list*

**Description:**

Computes and returns the minimum distance between any pair of points in a list of [x,y] coordinate pairs. This function examines all possible pairs of points and returns the smallest distance found. Useful for validating point distributions, checking spacing constraints, or analyzing geometric layouts.

**Usage:**

```
define GetMinDist(pts)
```

**Example:**

```
points <- [[0, 0], [10, 0], [5, 5], [100, 100]]
minDist <- GetMinDist(points)
Print(minDist)
# Result: 7.07107 (distance between [5,5] and [10,0])

# Check if points are spaced far enough apart
layout <- NonOverlapLayout(100, 400, 100, 400, 50, 20)
spacing <- GetMinDist(layout)
if(spacing < 50)
{
  Print("Warning: some points are too close together")
}
```

**See Also:**

NonOverlapLayout(), Dist()

### 11.8.24 HideObject()

*Hides a custom graphical object*

**Description:**

Hides a custom graphical object by hiding its canvas. This function is designed for use with complex custom objects that have a `.canv` property containing their graphical representation. The object remains in memory but is not displayed until shown again with `ShowObject()`. This is useful for temporarily removing custom stimuli from view without destroying them.

Usage:

```
define HideObject(obj)
```

Example:

```
# Create a custom object with a canvas
myObject <- MakeCustomShape() # hypothetical function

# Display the object
ShowObject(myObject)
Draw()
Wait(1000)

# Hide the object temporarily
HideObject(myObject)
Draw()
Wait(1000)

# Show it again
ShowObject(myObject)
Draw()
```

See Also:

ShowObject(), Hide(), Show()

### 11.8.25 LandoltRing()

*Creates a Landolt C ring stimulus for visual acuity testing*

**Description:**

Creates a Landolt C (also known as Landolt ring), a classic visual acuity stimulus used in optometry and vision research. The Landolt C is a ring with a gap at a specified angular position. Subjects identify the location of the gap to assess visual acuity. The function returns a canvas object containing the rendered stimulus.

The Landolt C was introduced by Edmund Landolt in 1888 (Landolt, E. *Méthode optométrique simple*. *Bull Mem Soc Fran Ophtalmol*. 1888;6:213–4) and remains a standard stimulus in visual psychophysics and clinical vision testing.

Parameters:

- **outer:** Outer diameter of the ring in pixels
- **inner:** Inner diameter (size of the central hole) in pixels

- **angle**: Angular position of the gap in degrees (0=right, 90=down, 180=left, 270=up)
- **lgap**: Width of the gap in pixels
- **color**: Color object for the ring
- **bgcolor**: Color object for the background and gap

Usage:

```
define LandoltRing(outer, inner, angle, lgap, color, bgcolor)
```

Example:

```
gWin <- MakeWindow()
black <- MakeColor("black")
white <- MakeColor("white")

# Create a Landolt C with gap on the right (0 degrees)
ring1 <- LandoltRing(100, 60, 0, 20, black, white)
AddObject(ring1, gWin)
Move(ring1, 200, 200)

# Create a smaller ring with gap at bottom (90 degrees)
ring2 <- LandoltRing(60, 40, 90, 12, black, white)
AddObject(ring2, gWin)
Move(ring2, 400, 200)

# Create rings at different orientations for acuity test
angles <- [0, 45, 90, 135, 180, 225, 270, 315]
loop(i, Sequence(1, Length(angles), 1))
{
  ring <- LandoltRing(80, 50, Nth(angles, i), 15, black, white)
  AddObject(ring, gWin)
  Move(ring, 100 + i*80, 300)
}

Draw()
WaitForAnyKeyPress()
```

See Also:

Circle(), BlockE(), MakeCanvas()

### 11.8.26 MakeTable()

*Creates a formatted table display with headers and data*

#### Description:

Creates a visual table object containing data arranged in rows and columns with headers. Returns a custom table object drawn on a canvas that can be added to a window and positioned like other graphical objects. The table includes horizontal rules separating the header from data and bordering the table. Headers can be multi-row (nested lists). Useful for displaying results, feedback, or structured information to participants.

Parameters:

- **data**: Nested list of data values (rows  $\times$  columns)
- **header**: List of column headers (can be nested for multi-row headers)
- **width**: Total width of the table in pixels
- **height**: Total height of the table in pixels
- **fontsize**: Base font size for table text
- **fgcol**: Foreground color object for text and lines
- **bgcolor**: Background color object for the table
- **layout**: Layout mode (default: 1)

Usage:

```
define MakeTable(data, header, width, height, fontsize, fgcol, bgcolor, layout: 1)
```

Example:

```
gWin <- MakeWindow()
black <- MakeColor("black")
white <- MakeColor("white")

# Create a simple results table
headers <- ["Trial", "RT (ms)", "Accuracy"]
data <- [[1, 523, "Correct"],
         [2, 456, "Correct"],
         [3, 678, "Error"],
         [4, 501, "Correct"]]

table <- MakeTable(data, headers, 400, 300, 16, black, white)
AddObject(table.canv, gWin)
```

(continues on next page)

(continued from previous page)

```
Move(table.canv, 400, 300)
Draw()
WaitForAnyKeyPress()
```

**See Also:**

MakeCanvas(), MakeLabel(), EasyLabel()

**11.8.27 ShowObject()**

*Shows a custom graphical object*

**Description:**

Shows a custom graphical object by displaying its canvas. This function is designed for use with complex custom objects that have a `.canv` property containing their graphical representation. Use this to display objects that were previously hidden with `HideObject()` or to initially display custom objects after creation. The object must have been created with a canvas property for this function to work properly.

**Usage:**

```
define ShowObject(obj)
```

**Example:**

```
# Create a custom object with a canvas
myObject <- MakeCustomShape() # hypothetical function

# Initially hide the object
HideObject(myObject)
Draw()

# Wait for user input
WaitForAnyKeyPress()

# Now show the object
ShowObject(myObject)
Draw()

# Toggle visibility
if(someCondition)
{
  ShowObject(myObject)
}
```

(continues on next page)

(continued from previous page)

```
} else {  
    HideObject(myObject)  
}
```

**See Also:**

HideObject(), Show(), Hide()

### 11.8.28 Functions Under Investigation

#### 11.8.29 ThickLine2()

**Warning: Under investigation.** This function's status is being reviewed.

**Usage:**

```
define ThickLine2(x1,y1,x2,y2,size,color)
```

## 11.9 HTML Library - HTML Generation

This library contains functions for generating HTML markup and web content.

### Function Index

- *B()*
- *BR()*
- *CT()*
- *Entag()*
- *H()*
- *HL()*
- *Img()*
- *MakeDivPage()*
- *OT()*
- *P()*

- *Page()*
- *Table()*

### 11.9.1 B()

**Description:**

Implements the HTML `<b>` tag. Wraps the provided text in bold tags to display it in bold font weight when rendered in HTML.

**Usage:**

```
define B(text)
```

**Example:**

```
report <- B("Important Result")
FilePrint(file, report)
## Produces: <b>Important Result</b>
```

**See Also:**

P(), H(), Entag()

### 11.9.2 BR()

**Description:**

Implements the HTML `<br>` tag. Returns a line break tag to create a new line in HTML output without starting a new paragraph.

**Usage:**

```
define BR()
```

**Example:**

```
text <- "Line 1" + BR() + "Line 2"
FilePrint(file, text)
## Produces: Line 1<br>Line 2
```

**See Also:**

P(), HL()

### 11.9.3 CT()

**Description:**

Closes an HTML tag by generating the closing tag syntax. This is a helper function used by other HTML functions to create properly formatted closing tags. Takes a tag name and returns `</tagname>`.

**Usage:**

```
define CT(tag)
```

**Example:**

```
closing <- CT("div")  
## Produces: </div>
```

**See Also:**

OT(), Entag()

### 11.9.4 Entag()

**Description:**

Generic function to wrap body content in any HTML tag. Takes a tag name and body text, then returns the body wrapped in opening and closing tags. Useful for creating custom HTML elements not covered by specific functions.

**Usage:**

```
define Entag(tag, body)
```

**Example:**

```
emphasized <- Entag("em", "This is important")  
## Produces: <em>This is important</em>  
  
div <- Entag("div", "Content in a div")  
## Produces: <div>Content in a div</div>
```

**See Also:**

OT(), CT(), P(), B()

### 11.9.5 H()

**Description:**

Implements HTML header tags <h1> through <h6>. Takes text and a level (1-6) and wraps the text in the appropriate header tag. Level 1 is the largest heading, level 6 is the smallest.

**Usage:**

```
define H(text, level)
```

**Example:**

```
title <- H("Test Results", 1)
## Produces: <h1>Test Results</h1>

subhead <- H("Section A", 2)
## Produces: <h2>Section A</h2>
```

**See Also:**

P(), B()

### 11.9.6 HL()

**Description:**

Creates a horizontal line element in HTML. Returns <h1> tag. Note: This appears to be a non-standard tag; standard HTML uses <hr> for horizontal rules.

**Usage:**

```
define HL()
```

**Example:**

```
separator <- HL()
FilePrint(file, separator)
```

**See Also:**

BR(), P()

### 11.9.7 `Img()`

**Description:**

Implements the HTML `<img>` tag. Creates an image element with specified filename and width. The filename should be a path to the image file, and width is specified in pixels.

**Usage:**

```
define Img(filename, width)
```

**Example:**

```
image <- Img("results_chart.png", 600)
## Produces: <img src='results_chart.png' width=600/>
```

**See Also:**

`Page()`, `Table()`

### 11.9.8 `MakeDivPage()`

**Description:**

Creates a page-formatted div container with automatic page numbering. Uses CSS classes ‘page’ and ‘subpage’ for styling (defined in `Page()` stylesheet). Automatically increments a global page counter (`gPage`) for multi-page reports. Useful for creating printable reports with consistent page formatting.

**Usage:**

```
define MakeDivPage(text)
```

**Example:**

```
page1 <- MakeDivPage(H("Report", 1) + P("Page content here"))
page2 <- MakeDivPage(H("Continued", 2) + P("More content"))
report <- Page(page1 + page2)
FilePrint(file, report)
```

**See Also:**

`Page()`, `H()`, `P()`

### 11.9.9 OT()

**Description:**

Opens an HTML tag by generating the opening tag syntax. This is a helper function used by other HTML functions to create properly formatted opening tags. Takes a tag name and returns `<tagname>`.

**Usage:**

```
define OT(tag)
```

**Example:**

```
opening <- OT("div")  
## Produces: <div>
```

**See Also:**

CT(), Entag()

### 11.9.10 P()

**Description:**

Implements the HTML `<p>` tag. Wraps the provided text in paragraph tags to create a standard HTML paragraph element.

**Usage:**

```
define P(text)
```

**Example:**

```
paragraph <- P("This is the first paragraph of the report.")  
FilePrint(file, paragraph)  
## Produces: <p>This is the first paragraph of the report.</p>
```

**See Also:**

H(), B(), BR()

### 11.9.11 Page()

#### Description:

Creates a complete HTML document with CSS styling suitable for printable reports. Wraps content in full HTML structure including head, style, and body tags. Provides default CSS for letter-size pages with print-friendly styling, or accepts custom CSS. The default stylesheet includes responsive table styling and page formatting optimized for 8.5x11 inch paper.

#### Usage:

```
define Page(text, style:0)
```

#### Example:

```
content <- H("Test Report", 1) + P("Results below:") +  
  ↪Table(data, ["Name", "Score"])  
html <- Page(content)  
FilePrint(file, html)  
  
## With custom CSS:  
customCSS <- "body { font-family: Arial; }"  
html <- Page(content, customCSS)
```

#### See Also:

MakeDivPage(), Table(), H(), P()

### 11.9.12 Table()

#### Description:

Implements HTML <table> markup. Converts a nested list (list of rows, where each row is a list of cells) into an HTML table. Optionally accepts a header list to create table column headers using <thead> and <th> tags. Data rows are automatically wrapped in <tr> and <td> tags. Works with the CSS styling provided by Page() for formatted, printable tables.

#### Usage:

```
define Table(tab, header:"")
```

#### Example:

```
## Simple table without headers:  
data <- [ ["John", 85], ["Mary", 92], ["Bob", 78] ]
```

(continues on next page)

(continued from previous page)

```
table <- Table(data)

## Table with headers:
data <- [["John", 85], ["Mary", 92], ["Bob", 78]]
headers <- ["Name", "Score"]
table <- Table(data, headers)

## In a full report:
report <- Page(H("Results", 1) + Table(data, headers))
FilePrint(file, report)
```

See Also:

Page(), MakeDivPage(), Entag()

## 11.10 Math Library - Extended Mathematical

This library contains extended mathematical functions beyond the core PE-BLMath namespace.

### Function Index

- *Bound()*
- *CumNormInv()*
- *CumSum()*
- *Dist()*
- *Filter()*
- *Match()*
- *NormalDensity()*
- *Order()*
- *Rank()*
- *SDTBeta()*
- *SDTDPrime()*
- *Sum()*
- *SummaryStats()*

- *VecSum()*
- *VecTimes()*
- *Max()*
- *Median()*
- *Min()*
- *StdDev()*

### 11.10.1 Bound()

*Returns val, bounded by min and max.*

**Description:**

This makes sure number is between min and max; if min>max, it will return max, so you need to check if that isn't the right behavior.

**Usage:**

```
define Bound(number,min,max)
```

### 11.10.2 CumNormInv()

*Returns accurate numerical approximation of cumulative normal inverse.*

**Description:**

This function takes a probability and returns the corresponding z-score for the cumulative standard normal distribution. It uses an accurate numerical approximation from: <http://home.online.no/~pjacklam/notes/invnorm>

**Usage:**

```
define CumNormInv(...)
```

**Example:**

```
Print(CumNormInv(0))      #= NA
Print(CumNormInv(.01))    #= -2.32634
Print(CumNormInv(.5))     #= 0
Print(CumNormInv(.9))     #= 1.28
Print(CumNormInv(1))      #= NA
```

**See Also:**

NormalDensity(), RandomNormal()

### 11.10.3 CumSum()

*Returns the cumulative sums of a set of numbers*

**Description:**

Returns the cumulative sum of <list>.

**Usage:**

```
define CumSum(...)
```

**Example:**

```
sum <- CumSum([1,2,3,3,4,7])  
# == [1,3,6,9,13,20]
```

**See Also:**

Min(), Max(), Mean(), Median(), Quantile(), StDev()

### 11.10.4 Dist()

*Returns distance between two points.*

**Description:**

Returns Euclidean distance between two points. Each point should be [x,y], and any additional items in the list are ignored.

**Usage:**

```
define Dist(...)
```

**Example:**

```
p1 <- [0,0]  
p2 <- [3,4]  
d <- Dist(p1,p2) #d is 5
```

### 11.10.5 Filter()

*Filters a list based on a 0/1 list produced by Match.*

**Description:**

Returns a subset of <list>, depending on whether the <filter> list is zero or nonzero. Both arguments must be lists of the same length.

**Usage:**

```
define Filter(...)
```

**Example:**

```
x <- [1,2,3,3,2,2,1]
Print(Filter(x,[1,1,1,0,0,0,0])) ##== [1,2,3]
Print(Filter(x,Match(x,1)))    ##== [1,1]
```

**See Also:**

Match(), Subset(), Lookup()

### 11.10.6 Match()

*Returns a list of 0/1s, indicating which elements of list match item.*

**Description:**

Returns a list of 0/1, indicating which elements of <list> match <target>

**Usage:**

```
define Match(...)
```

**Example:**

```
x <- [1,2,3,3,2,2,1]
Print(Match(x,1))  ##== [1,0,0,0,0,0,1]
Print(Match(x,2))  ##== [0,1,0,0,1,1,0]
Print(Match(x,3))  ##== [0,0,1,1,0,0,0]
```

**See Also:**

Filter(), Subset(), Lookup()

### 11.10.7 NormalDensity()

*Returns density of standard normal distribution.*

**Description:**

Computes density of normal standard distribution

**Usage:**

```
define NormalDensity(...)
```

**Example:**

```
Print(NormalDensity(-100))      # 1.8391e-2171
Print(NormalDensity(-2.32635))  #5.97
Print(NormalDensity(0))         #0.398942
Print(NormalDensity(1.28155))   #.90687
Print(NormalDensity(1000))      #inf
```

**See Also:**

RandomNormal(), CumNormInv()

### 11.10.8 Order()

**Description:**

Returns a list of indices describing the order of values by position, from min to max.

**Usage:**

```
define Order(...)
```

**Example:**

```
n <- [33,12,1,5,9]
o <- Order(n)
Print(o) #should print [3,4,5,2,1]
```

**See Also:**

Rank()

### 11.10.9 Rank()

**Description:**

Returns a list of numbers describing the rank of each position, from min to max. The same as calling `Order(Order(x))`.

**Usage:**

```
define Rank(...)
```

**Example:**

```
n <- [33,12,1,5,9]
o <- Rank(n)
Print(o) #should print [5,4,1,2,3]
```

**See Also:**

`Order()`

### 11.10.10 SDTBeta()

*Computes SDT beta.*

**Description:**

`SDTBeta` computes beta, as defined by signal detection theory. This is a measure of decision bias based on hit rate and false alarm rate.

**Usage:**

```
define SDTBeta(...)
```

**Example:**

```
Print(SDTBeta(.1,.9))
Print(SDTBeta(.1,.5))
Print(SDTBeta(.5,.5))
Print(SDTBeta(.8,.9))
Print(SDTbeta(.9,.95))
```

**See Also:**

`SDTDPrime()`

### 11.10.11 SDTDPrime()

*Computes SDT dprime.*

**Description:**

SDTDPrime computes d-prime, as defined by signal detection theory. This is a measure of sensitivity based jointly on hit rate and false alarm rate.

**Usage:**

```
define SDTDPrime(...)
```

**Example:**

```
Print(SDTDPrime(.1,.9)) #2.56431
Print(SDTDPrime(.1,.5)) #1.28155
Print(SDTDPrime(.5,.5)) #0
Print(SDTDPrime(.8,.9)) #.43993
Print(SDTDPrime(.9,.95)) #.363302
```

**See Also:**

SDTBeta(),

### 11.10.12 Sum()

**Description:**

Returns the sum of <list>.

**Usage:**

```
define Sum(...)
```

**Example:**

```
sum <- Sum([3,5,99,12,1.3,15]) # == 135.3
```

**See Also:**

Min(), Max(), Mean(), Median(), Quantile(), StDev()

### 11.10.13 SummaryStats()

**Description:**

Computes summary statistics for a data list, aggregated by labels in a condition list. For each condition (distinct label in the <cond> list), it will return a list with the following entries: <cond> <N> <median> <mean> <sd>

**Usage:**

```
define SummaryStats(...)
```

**Example:**

```
dat <- [1.1,1.2,1.3,2.1,2.2,2.3]
cond <- [1,1,1,2,2,2]
Print(SummaryStats(dat,cond))
```

**Result:**

```
[[1, 3, 1.1, 1.2, 0.0816497]
, [2, 3, 2.1, 2.2, 0.0816497]
]
```

**See Also:**

StDev(), Min(), Max(), Mean(), Median(), Quantile(), Sum()

### 11.10.14 VecSum()

*Returns the pairwise sums of two lists of numbers*

**Description:**

Returns the pairwise sums of <list1> and <list2>.

**Usage:**

```
define VecSum(...)
```

**Example:**

```
sum <- VecSum([1,1,1,1,2],[2,3,4,3,2])
## == [3,4,5,4,4]
```

**See Also:**

VecTimes(), CumSum(), Median(), Quantile()

### 11.10.15 VecTimes()

*Returns the pairwise products of two lists of numbers*

**Description:**

Returns the pairwise sums of <list1> and <list2>.

**Usage:**

```
define VecTimes(...)
```

**Example:**

```
prod <- VecTimes([1,1,2,2,3],[2,3,4,3,2])  
## == [2,3,8,6,6]
```

**See Also:**

VecSum(), Mean(), CumSum()

### 11.10.16 Max()

*Returns the largest value in a list*

**Description:**

Max returns the largest value in a list. This is a PEBL function that wraps the compiled Max function, adding error checking to ensure the argument is a list.

**Usage:**

```
define Max(list)
```

**Example:**

```
numbers <- [3, 7, 2, 9, 4]  
max_value <- Max(numbers) # Returns 9
```

**See Also:**

Min(), Mean(), Median(), StdDev()

### 11.10.17 Median()

*Returns the median value of a list*

**Description:**

Median returns the median value of a list. If the list has an even number of elements, it returns the average of the two middle values. This is a PEBL function that provides error checking and handles edge cases.

**Usage:**

```
define Median(list)
```

**Example:**

```
numbers1 <- [3, 7, 2, 9, 4]
med1 <- Median(numbers1) # Returns 4

numbers2 <- [1, 2, 3, 4]
med2 <- Median(numbers2) # Returns 2.5
```

**See Also:**

Mean(), Min(), Max(), Quantile(), StdDev()

### 11.10.18 Min()

*Returns the smallest value in a list*

**Description:**

Min returns the smallest value in a list. This is a PEBL function that wraps the compiled Min function, adding error checking to ensure the argument is a list.

**Usage:**

```
define Min(list)
```

**Example:**

```
numbers <- [3, 7, 2, 9, 4]
min_value <- Min(numbers) # Returns 2
```

**See Also:**

Max(), Mean(), Median(), StdDev()

### 11.10.19 StdDev()

*Returns the standard deviation of a list*

**Description:**

StdDev computes the standard deviation of a list of numbers. It uses the formula:  $\sqrt{n * \sum(x^2) - (\sum(x))^2 / n}$ . Returns 0 for empty lists. This is a PEBL function implemented in Math.pbl.

**Usage:**

```
define StdDev(list)
```

**Example:**

```
data <- [2, 4, 4, 4, 5, 5, 7, 9]
sd <- StdDev(data) # Calculates standard deviation
```

**See Also:**

Mean(), Median(), Min(), Max(), Sum(), SummaryStats()

## 11.11 UI Library - User Interface

This library contains functions for creating user interface elements like buttons, textboxes, and checkboxes.

### Function Index

- *ClearScrollbarThumbCapture()*
- *ClickCheckbox()*
- *ClickOnMenu()*
- *ClickOnScrollbar()*
- *CopyTextBox()*
- *DrawPulldown()*
- *DrawScrollbar()*
- *DrawScrollingTextBox()*
- *EditScrollbarValue()*
- *FilterList()*

- *GetFullLineBreaks()*
- *InsideMenu()*
- *InsideTB()*
- *MakeButton()*
- *MakeCheckbox()*
- *MakeMenu()*
- *MakeMenuItem()*
- *MakePulldown()*
- *MakeScrollBar()*
- *MakeScrollingTextBox()*
- *MakeTextList()*
- *OpenSubMenus()*
- *PasteTextBox()*
- *PopUpEntryBox()*
- *PopupMessageBox()*
- *PushButton()*
- *Pulldown()*
- *SetScrollingText()*
- *SetCheckbox()*
- *SetTextBoxCursorFromClick()*
- *SortDir()*
- *UpdatePulldown()*
- *UpdateScrollbar()*
- *VecPlus()*

### 11.11.1 ClearScrollbarThumbCapture()

#### Description:

this supposedly gets called on a mouse release event? it should also get called when you leave the window...

#### Usage:

```
define ClearScrollbarThumbCapture(obj,p,event:0) #+
```

### 11.11.2 ClickCheckbox()

*Toggles checkbox state*

#### Description:

This ‘clicks’ a checkbox, changing its status (both the visual display and its .status property). Its state can also be set using the SetCheckBox() function. The text “ClickCheckBox” is by default bound to the .clickon property of any checkbox, enabling you to handle a number of graphical objects the same (see CallFunction example). The [x,y] coordinates are ignored, and so anything can be fed to them, but the standard approach is to use gClick, which is a global bound to the last click coordinates when WaitForClickOnTarget is used.

#### Usage:

```
ClickCheckBox(obj, [x,y])
```

#### Example:

```
##The following creates a button, waits for you to click on it,
↳and animates a button press

ok <- MakeCheckbox("OK?",400,250,gWin,150)
resp <- WaitForClickOnTarget([ok],[1])
ClickCheckBox(ok,gClick)
Draw()

##You can handle a bunch of objects together using an idiom like
↳this:

ok <- MakeCheckbox("OK?",400,250,gWin,150)
ok2 <- MakeCheckbox("Otherwise?",400,280,gWin,150)
checks <- [ok,ok2]
resp <- WaitForClickOnTarget(checks,[1,2])
```

(continues on next page)

(continued from previous page)

```
check <- Nth(checks,resp)
CallFunction(check.clickon,[check,gClick])
Draw()
```

**See Also:**

MakeCheckBox(), SetCheckBox()

### 11.11.3 ClickOnMenu()

*Handles menu click, calling the .clickon function of menu.*

**Description:**

Handles clicking on a menu item. It will call the .clickon property of that item, and then hide the menu.

**Usage:**

```
define ClickOnMenu(...)
```

**Example:**

This creates a menu and awaits clicking on. More complete  
→ examples are available in ui.pbl. It requires that MyMessage  
→ is created somewhere

```
menu1 <- MakeMenuItem("File",0,0,gWin,14,10,"MYMESSAGE")

menu2<- MakeMenu("Edit",70,0,gWin,14,10, "MYMESSAGE")

menus <- [menu1,menu2]
opt <- WaitForClickOnTarget(menu,[1,2])
ClickOnMenu(Nth(menus,opt),gClick)
```

**See Also:**

MakeMenu(), OpenSubMenus(), MakeMenuItem()

### 11.11.4 ClickOnScrollbar()

*Handles click on scrollbar.*

#### Description:

Handles a click event on the a `Scrollbar`. This should be called after one checks (e.g., via `InsideTB`) whether the scrollbar was actually clicked on. It will handle scrolling, moving via the thumb, up/down arrows, and reselection. It is also used to interact with `ScrollingTextBox` objects. This function name is bound to the `.clickon` property of scrollboxes, so it can be called using `CallFunction` (see example below).

#### Usage:

```
define ClickOnScrollbar(...)
```

#### Example:

See `ui.pbl` in the demo directory for examples of the use of a `scrolling text box`. A brief example follows:

```
sb <- MakeScrollbar(Sequence(1,50,1),"The numbers",40,40,gWin,
↳12,150,500,3)
Draw()

resp <- WaitForClickOnTarget([sb],[1])
ClickOnScrollbar(sb,gClick)

#Alternately: CallFunction(sb.clickon,[sb,gClick])

##change the selected items
sb.list <- Sequence(sb.selected,sb.selected+50,1)
UpdateScrollbar(sb)
DrawScrollbar(sb)
Draw()
```

#### See Also:

`MakeScrollingTextBox` `MakeScrollbar` `UpdateScrollbar` `DrawScrollbar`

### 11.11.5 CopyTextBox()

*Copies textbox content to clipboard*

**Description:**

Copies the text content of a textbox to the system clipboard. This function is typically bound to a right-click menu on textboxes, allowing users to copy text for pasting into other applications or textboxes within PEBL.

**Usage:**

```
CopyTextBox(menu, xy, box)
```

**Example:**

```
##Create a textbox with some text
font <- MakeFont("DejaVuSans.ttf", 0, 14, MakeColor("black"),
↳MakeColor("white"), 1)
textbox <- MakeTextBox("Sample text to copy", font, 300, 100)
AddObject(textbox, gWin)
Move(textbox, 320, 240)
Draw()

##Copy the textbox content (typically called from a right-click
↳menu)
CopyTextBox(0, [0,0], textbox)

##Now clipboard contains "Sample text to copy"
```

**See Also:**

PasteTextBox(),          CopyToClipboard(),          CopyFromClipboard(),  
MakeTextBox()

### 11.11.6 DrawPulldown()

*Redraws a pulldown if state changes.*

**Description:**

This handles layout/drawing of a pulldown box. This does not actually call Draw() on the window, and so an additional draw command is needed before the output is displayed. The main use case for this function is if you need to manually change the selected object (by changing .selected). This will redraw the pulldown with the new selection.

**Usage:**

```
define DrawPulldown(...)
```

**Example:**

```
options <- MakePullbutton(["A","B","C"],400,250,gWin,14,100,
↪1)
Draw()
WaitForAnyKeyPress()
options.selected <- 2
DrawPulldown(options)
Draw()
WaitForAnyKeyPress()
```

**See Also:**

MakePullDown(), Pulldown(), UpdatePulldown()

**11.11.7 DrawScrollbar()**

*Redraws a scrollbar*

**Description:**

Redraws a ScrollBox. This is called by various internal functions, but should be used to handle redrawing if UpdateScrollbar is used. When things like the scrollbar, offset, and selected item change, this can be called directly. If the actual list is changed, UpdateScrollBox should be called first. Note that the redrawn scrollbar won't be changed on the screen until a Draw() command is issued.

**Usage:**

```
DrawScrollBox(sb)
```

**Example:**

```
sb <- MakeScrollBox(Sequence(1,50,1),"The numbers",40,40,gWin,12,
↪150,500,3)
Draw()

resp <- WaitForClickOnTarget([sb],[1])
CallFunction(sb.clickon,[sb,gClick])
##Alternately: ClickOnScrollbar(sb,gClick)

##change the selected items
sb.list <- Sequence(sb.selected,sb.selected+50,1)
```

(continues on next page)

(continued from previous page)

```
UpdateScrollbar(sb)
DrawScrollbar(sb)
Draw()
```

**See Also:**

MakeScrollingTextBox(),      MakeScrollBar(),      UpdateScrollBar(),  
ClickOnScrollBar()

### 11.11.8 DrawScrollingTextBox()

**Description:**

this draws the current state of the scrollbar. It should be called directly whenever things like the scrollbar, offset, selected item are changed, but not when the list changes. the only material side effect it can have is changing selected, which will update to ensure it stays within bounds.

**Usage:**

```
define DrawScrollingTextBox(obj)
```

### 11.11.9 EditScrollbarValue()

**Description:**

make this separate so you can override for more custom edits. see launcher experiment chain, where the chain is just a set of labels that link to the ‘real’ chain.

**Usage:**

```
define EditScrollbarValue(win,click,default,selected)
```

### 11.11.10 FilterList()

*Filters a list by substring match*

**Description:**

Filters a list to include only items that contain a specified substring. This function searches each item in the list for the filter string and returns a new list containing only matching items. The search is case-sensitive and matches any occurrence of the filter string within each list item.

Usage:

```
FilterList(list, filter)
```

Example:

```
##Filter a list of files to show only .txt files
files <- ["data1.txt", "data2.csv", "notes.txt", "readme.md"]
txtFiles <- FilterList(files, ".txt")
##Returns: ["data1.txt", "notes.txt"]

##Filter a list of names
names <- ["Alice", "Bob", "Charlie", "David"]
aNames <- FilterList(names, "a")
##Returns: ["Charlie", "David"] (contains lowercase 'a')
```

See Also:

FindInString(), SubString(), Filter()

#### 11.11.11 GetFullLineBreaks()

Description:

this attempts to get the full set of linebreaks from the text attached to tb

Usage:

```
define GetFullLineBreaks(tb, text)
```

#### 11.11.12 InsideMenu()

Description:

This is offset from upper left corner

Usage:

```
define InsideMenu(xy, object)#+
```

### 11.11.13 InsideTB()

*Determine inside for a textbox-style object (location is upper left)*

**Description:**

Determines whether an [x,y] point is inside an object having .x, .y, .width, and .height properties, with .x and .y representing the upper left corner of the object. This is bound to the .inside property of many custom ui objects. The **Inside** function will use the function bound to the .inside property for any custom object having that property, and so this function's use is mainly hidden from users.

**Usage:**

```
define InsideTB(...)
```

**Example:**

```
pulldown <- MakePulldown(["one", "two", "three", "four"], 400-75, 300,
  ↪gWin, 12, 150, 1)

if(InsideTB([300, 300], pulldown))
{
  Print("INSIDE")
}
```

**See Also:**

Inside(), MoveObject(), ClickOn(), DrawObject()

### 11.11.14 MakeButton()

*Makes a button for clicking on.*

**Description:**

Creates a button on a window that can be clicked and launches actions. The button is always 20 pixels high (using images in media images), with a rounded grey background. The label text will be shrunk to fit the width, although this should be avoided as it can look strange. A button is a custom object made from images and text. It has a property 'clickon' that is bound to 'PushButton' A button will look like this: **Usage:**

```
define MakeButton(...)
```

**Example:**

The following creates a button, waits for you to click on it,  and animates a button press

```
done <- MakeButton("QUIT",400,250,gWin,150)
resp <- WaitForClickOnTarget([done],[1])
CallFunction(done.clickon,[done,gClick])
```

See Also:

PushButton(), MakeCheckBox()

### 11.11.15 MakeCheckbox()

*Creates a checkbox widget*

#### Description:

Creates a checkbox on a window that can be clicked and keeps track of its status. The checkbox uses a MakeButton object as its base. The checkbox button is always 20 pixels high (using images in media/images), with a rounded grey background. The label text will be shrunk to fit the width, although this should be avoided as it can look strange. It has a property 'clickon' that is bound to ClickCheckBox, which flips its state and updates the graphics. It has a property state which is either 0 or 1, depending on the state of the checkbox. Its initial state is 0. Its state can be set using the SetCheckBox() function.

#### Usage:

```
MakeCheckBox(label, x, y, window, width)
```

#### Example:

```
##The following creates a button, waits for you to click on it, 
↳and animates a button press

ok <- MakeCheckbox("OK?",400,250,gWin,150)
resp <- WaitForClickOnTarget([ok],[1])
CallFunction(ok.clickon,[ok,gClick])
Draw()

##Alternately:

ok <- MakeCheckbox("OK?",400,250,gWin,150)
resp <- WaitForClickOnTarget([ok],[1])
```

(continues on next page)

(continued from previous page)

```
ClickCheckBox(ok,gClick)
Draw()
```

**See Also:**

ClickCheckBox(), SetCheckBox()

### 11.11.16 MakeMenu()

*Creates menu with suboptions.*

**Description:**

Creates a menu containing multiple menu items, that automatically call functions specified by the command.

**Usage:**

```
define MakeMenu(...)
```

**Example:**

This creates a menu and awaits clicking on. More complete examples are available in ui.pbl. It requires that MyMessage is created somewhere

```
menu1 <- MakeMenu("File",0,0,gWin,14,10,
  ["Open","Save","Save as","Quit"],
  ["MYMESSAGE","MYMESSAGE","MYMESSAGE","MYMESSAGE"])

menu2<- MakeMenu("Edit",70,0,gWin,14,10,
  ["Cut","Copy","Paste","Select"],
  ["MYMESSAGE","MYMESSAGE","MYMESSAGE","MYMESSAGE"])

menu <- [menu1,menu2]
opt <- WaitForClickOnTarget(menu,[1,2])
ClickOnMenu(Nth(menu,opt),gClick)
```

**See Also:**

MakeMenuItem(), OpenSubMenus(), ClickOnMenu()

### 11.11.17 MakeMenuItem()

*Creates menu sub-item.*

#### Description:

Creates a single menu containing a label, whose .clickon property is bound to some other function.

#### Usage:

```
define MakeMenuItem(...)
```

#### Example:

This creates a menu and awaits clicking on. More complete examples are available in ui.pbl. It requires that MyMessage is created somewhere

```
menu1 <- MakeMenuItem("File",0,0,gWin,14,10,"MYMESSAGE")

menu2<- MakeMenu("Edit",70,0,gWin,14,10, "MYMESSAGE")

menus <- [menu1,menu2]
opt <- WaitForClickOnTarget(menu,[1,2])
ClickOnMenu(Nth(menus,opt),gClick)
```

#### See Also:

MakeMenu(), OpenSubMenus(), ClickOnMenu

### 11.11.18 MakePulldown()

*Creates a pulldown selection list*

#### Description:

Creates a pulldown list that can be used to select an option. The closed version is always 20 pixels high. When opened, it will be by default 15 rows high, although this is made smaller if the pulldown is close to the bottom of the screen. A pulldown is a custom object made from images and text. It has a property 'clickon' that is bound to 'Pulldown'.

#### Usage:

```
MakePulldown(options, x, y, window, fontsize, width, selected)
```

### Parameters:

The options argument is a list of options you want to appear. x and y are the coordinates of the upper left corner, window is the name of the window (or other graphical object) it appears on, fontsize is the size of the font, and width is the width of the pulldown in pixels. The selected argument is the initial selected list item.

Pulldown objects have a property .maxitems, that specify how many elements are displayed. If the list contains more than obj.maxitems, the pulldown will enable scrolling. A pulldown's click-on handler is by default bound to the 'Pull-down' function. When Pulldown(obj,mousexy) is called, it will pop open the pulldown, allow for a new option to be selected, and return. It returns the index of the selected object, but the selected index can also be accessed using obj.selected.

### Example:

```
##See ui.pbl in the demo directory for examples of the use of ↵
↵pulldowns.
##A basic example is:

options <- MakePulldownButton(["A","B","C"],400,250,gWin,14,100,
↵1)
resp <- WaitForClickOnTarget([options],[1])
CallFunction(options.clickon,[options,gClick])
```

### See Also:

PullDown(), DrawPulldown(), UpdatePulldown()

## 11.11.19 MakeScrollBar()

*Make a scrolling selection box.*

### Description:

Creates a graphical object that displays and allows selection of a list of items, and scrolls if the text gets too big. It has a property 'clickon' that is bound to 'ClickOnScrollBar' A Scrolling textbox looks like this: **Usage:**

```
define MakeScrollBar(...)
```

### Example:

```
See ui.pbl in the demo directory for examples of the use of a ↵
↵scrolling text box
```

(continues on next page)

(continued from previous page)

```

sb <- MakeScrollBar(Sequence(1,50,1),"The numbers",40,40,gWin,
↳12,150,500,3)

Draw()
resp <- WaitForClickOnTarget([sb],[1])
CallFunction(sb.clickon,[sb,gClick])
#Alternately: ClickOnScrollbar(sb,gClick)

```

**See Also:**

SetScrollingText MakeScrollingTextBox UpdateScrollBar DrawScrollBar  
ClickOnScrollBar

**11.11.20 MakeScrollingTextBox()**

*Make a box for text that can be scrolled if too long.*

**Description:**

Creates a graphical object that displays a block of text, and scrolls if the text gets too big. It uses a `Scrollbar` as its base, but handles parsing the text into lines and hides the selection box. Thus, no ‘selection’ is displayed (although it actually exists), and a `.text` property is added to hold the text being displayed. It has a property ‘clickon’ that is bound to ‘ClickOnScrollBar’. A Scrolling textbox looks like this: **Usage:**

```
define MakeScrollingTextBox(...)
```

**Example:**

See `ui.pbl` in the demo directory for examples of the use of a  
↳scrolling text box

```

textscroll <- MakeScrollingTextBox("",200,50,gWin,12,
300,150,0)

SetScrollingText(textscroll,FileReadText("Uppercase.txt"))
Draw()
resp <- WaitForClickOnTarget([textscroll],[1])
CallFunction(textscroll.clickon,[textscroll,gClick])

```

**See Also:**

SetScrollingText    MakeScrollBar    UpdateScrollBar    DrawScrollBar  
ClickOnScrollBar

### 11.11.21 MakeTextList()

*Creates a text body from a list.*

**Description:**

This takes a list and creates a block of text with carriage returns, ensuring each item of the list is on its own line; it also requires an offset, skipping the first lines of the list. It is mostly a helper function used by `Scrollbar` objects to help format. It will make text out of the entire list, so you should be sure to cut off the end for efficiency if you only want to display some of the lines.

**Usage:**

```
define MakeTextList(...)
```

**Example:**

```
letters <- FileReadList("Uppercase.txt")  
out <- MakeTextList(letters,20,"--")
```

The above code will create the following:

```
--u  
--v  
--w  
--x  
--y  
--z
```

**See Also:**

ListToString

### 11.11.22 OpenSubMenus()

*Opens the sub-menus of a menu.*

**Description:**

Used by ClickOnMenu to open, display a submenu and get a click.

**Usage:**

```
define OpenSubMenus(...)
```

**Example:**

```
This creates a menu and awaits clicking on. More complete
examples are available in ui.pbl. It requires that MyMessage
is created somewhere
```

```
menu1 <- MakeMenuItem("File",0,0,gWin,14,10,"MYMESSAGE")

menu2<- MakeMenu("Edit",70,0,gWin,14,10, "MYMESSAGE")

menus <- [menu1,menu2]
opt <- WaitForClickOnTarget(menu,[1,2])
ClickOnMenu(Nth(menus,opt),gClick)
```

**See Also:**

MakeMenu(), OpenSubMenus(), MakeMenuItem()

### 11.11.23 PasteTextBox()

*Pastes clipboard content into textbox*

**Description:**

Pastes text from the system clipboard into a textbox, replacing its current content. This function is typically bound to a right-click menu on textboxes, allowing users to paste text from other applications or from previously copied PEBL textbox content. The textbox is automatically redrawn after pasting.

**Usage:**

```
PasteTextBox(menu, xy, box)
```

**Example:**

```
##First, copy some text to clipboard
CopyToClipboard("Hello from PEBL!")

##Create a textbox
font <- MakeFont("DejaVuSans.ttf", 0, 14, MakeColor("black"),
↵MakeColor("white"), 1)
textbox <- MakeTextBox("", font, 300, 100)
AddObject(textbox, gWin)
Move(textbox, 320, 240)
Draw()

##Paste clipboard content into the textbox (typically called
↵from a right-click menu)
PasteTextBox(0, [0,0], textbox)

##Now textbox.text contains "Hello from PEBL!"
```

See Also:

CopyTextBox(), CopyToClipboard(), CopyFromClipboard(), MakeTextBox()

#### 11.11.24 PopUpEntryBox()

**Description:**

Creates a small text-entry box at a specified location..

**Usage:**

```
define PopUpEntryBox(...)
```

**Example:**

```
subnum <- PopUpEntryBox("Enter participant code",gWin,[100,100])
```

See Also:

MessageBox GetEasyInput, PopUpMessageBox

### 11.11.25 PopUpMessageBox()

*Creates a popup message box*

#### Description:

Creates a small 300x200 information box at the current cursor location, but also adjusts so it is on the screen. It must be dismissed by clicking the 'OK' button. Note that the function puts the box on the screen at the current mouse position. If you want control over where it goes, you need to use SetCursorPosition immediately before the box is made.

#### Usage:

```
PopUpMessageBox(<text>, <win>)
```

#### Example:

```
subnum <- PopUpMessageBox("There has been an error.",gWin)
```

#### See Also:

MessageBox(), GetEasyInput(), PopUpEntryBox()

### 11.11.26 PushButton()

*Pushes a button and releases.*

#### Description:

Animates a button-pushing. It takes a button created using the MakeButton function and will animate a downclick when the mouse is down, and release when the mouse is unclicked. To conform with general object handlers, it requires specifying a mouse click position, which could be [0,0], or gclick. This function is bound to the property 'clickon' of any button, allowing you to handle mouse clicks universally for many different objects.

#### Usage:

```
define PushButton(...)
```

#### Example:

```
The following creates a button, waits for you to click on it,
↳and animates a button press
```

```
done <- MakeButton("QUIT",400,250,gWin,150)
```

(continues on next page)

(continued from previous page)

```
resp <- WaitForClickOnTarget([done], [1])
PushButton(done, [0,0])
```

To handle multiple buttons, you can do:

```
done <- MakeButton("QUIT", 400, 250, gWin, 150)
ok <- MakeButton("OK", 400, 250, gWin, 150)

resp <- 2
while (resp != 1)
{
  Draw()
  resp <- WaitForClickOnTarget([done,ok], [1,2])
  obj <- Nth([done,ok], resp)
  CallFunction(obj.clickon, [obj, gClick])
}
```

See Also:

MakeCheckBox()

### 11.11.27 Pulldown()

*Handles pulldown interaction*

#### Description:

This handles making a new selection on a pulldown box. This function is typically the primary way of interacting with a pulldown box. It will have the effect of opening the pulldown box, waiting for the user to select a new option, and then changing the selected option to whatever they click on.

#### Usage:

```
Pulldown(object, [x,y])
```

#### Example:

```
##See ui.pbl in the demo directory for examples of the use of
↳ pulldowns.
##A basic example is:

options <- MakePulldownButton(["A", "B", "C"], 400, 250, gWin, 14, 100,
```

(continues on next page)

(continued from previous page)

```
↪1)
resp <- WaitForClickOnTarget([options],[1])
newvalue <- Pulldown(options,gClick)
```

**See Also:**

MakePullDown(), DrawPullDown(), UpdatePullDown()

### 11.11.28 SetScrollingText()

*Changes text of a scrolling textbox.*

**Description:**

This updates the text in a `ScrollingTextBox`. Because text must be parsed to be put into the box, you cannot just update the `.text` property, but instead should use this function.

**Usage:**

```
define SetScrollingText(...)
```

**Example:**

See `ui.pbl` in the demo directory for examples of the use of a scrolling text box. A brief example follows:

```
textscroll <- MakeScrollingTextBox("",200,50,gWin,12,
                                   300,150,0)

SetScrollingText(textscroll,FileReadText("Uppercase.txt"))
Draw()
resp <- WaitForClickOnTarget([textscroll],[1])
CallFunction(textscroll.clickon,[textscroll,gClick])
```

**See Also:**

MakeScrollingTextBox MakeScrollBox UpdateScrollBox DrawScrollBox  
ClickOnScrollBox

### 11.11.29 SetCheckbox()

*Sets checkbox state*

**Description:**

This sets the .status property of a checkbox and draws it. Its state can also be updated using the ClickCheckBox() function, which flips the current state.

**Usage:**

```
SetCheckBox(obj, value)
```

**Example:**

```
ok <- MakeCheckbox("OK?",400,250,gWin,150)
Draw()
SetCheckBox(ok,1)
Draw()
Wait(1000)
SetCheckbox(ok,0)
Draw()
Wait(1000)
```

**See Also:**

MakeCheckBox(), ClickCheckBox()

### 11.11.30 SetTextBoxCursorFromClick()

**Description:**

this is used directly by a compiled function GetInput0 to reset the cursor position in any getinput thing.

**Usage:**

```
define SetTextBoxCursorFromClick(box, exit, click)
```

## Chapter 12

# Color Name Reference

In PEBL, around 750 colors can be accessed by name, using the `MakeColor()` function. Each name corresponds to a specific RGB value. The following table provides examples of the particular color names, RGB values, and the obtained shade produced by PEBL.

**Table 1:** Color Reference

Color Name	Red	Green	Blue	Example
ALICE BLUE	240	248	255	
ALICEBLUE	240	248	255	
ANTIQUE WHITE	250	235	215
